A CAUTION

This manual is provided for reference only. It does NOT provide instructions on how to operate your chamber. Not all features or functions are applicable.

The Series F4 Temperature Controller has been properly configured by TestEquity to match the chamber's system requirements and to perform optimally over a wide range of operating conditions. Improper modifications to these setup values can result in erratic performance and unreliable operation. Setup examples in the "Series F4 User's Manual" are NOT applicable to this chamber. Do not attempt to modify the setup values, unless you thoroughly understand what you are doing. If there is any doubt, please call TestEquity before proceeding. The correct values are documented in the "Series F4 Temperature Controller Setup Parameters" section of the TestEquity chamber manual.

NEVER select "Full Defaults" in the Series F4 Controller's Factory/Test Menu. This will erase all the correct values which are documented in the "Series F4 Temperature Controller Setup Parameters" section of the TestEquity chamber manual.

About Watlow Winona

Watlow Winona is a division of Watlow Electric Mfg. Co., St. Louis, Missouri, a manufacturer of industrial electric heating products since 1922. Watlow begins with a full set of specifications and completes an industrial product that is manufactured in-house, in the U.S.A. Watlow products include electric heaters, sensors, controllers and switching devices. The Winona operation has been designing solid-state electronic control devices since 1962, and has earned the reputation as an excellent supplier to original equipment manufacturers. These OEMs and end users depend upon Watlow Winona to provide compatibly engineered controls that they can incorporate into their products with confidence. Watlow Winona resides in a 100,000-square-foot marketing, engineering and manufacturing facility in Winona, Minnesota.

About This Manual

The Series F4 User's Manual covers hardware and software in both the **Single-Channel** and **Dual-Channel** controllers. Instructions and illustrations pertain to both unless otherwise specified. If a given feature or parameter operates on only the Single or the Dual Channel controller, it will be identified by an icon in the margin or nearby.

Your Comments

Your comments or suggestions on this manual are welcome. Please send them to the Technical Literature , Watlow Winona, 1241 Bundy Boulevard, P.O. Box 5580, Winona, Minnesota, 55987-5580 U.S.; Telephone: +1 (507) 454-5300; fax: +1 (507) 452-4507.

Safety Alert CAUTION or WARNING

Electrical Shock Hazard

CAUTION or WARNING

Safety Information in this Manual

Note, caution and warning symbols appear throughout this book to draw your attention to important operational and safety information.

A "NOTE" marks a short message to alert you to an important detail.

A "CAUTION" safety alert appears with information that is important for protecting your equipment and performance.

A "WARNING" safety alert appears with information that is important for protecting you, others and equipment from damage. Pay very close attention to all warnings that apply to your application.

The $\underline{\wedge}$ symbol (an exclamation point in a triangle) precedes a general CAUTION or WARNING statement.

The A symbol (a lightning bolt in a lightning bolt in a triangle) precedes an electric shock hazard CAUTION or WARNING safety statement.

Technical Assistance

If you encounter a problem with your Watlow controller, review all configuration information to verify that your selections are consistent with your application: inputs; outputs; alarms; limits; etc. If the problem persists after checking the above, you can get technical assistance by calling your local Watlow representative (see back cover of this manual), or in the U.S., dial +1 (507) 494-5656. For technical support, ask for an Applications Engineer.

Please have the following information available when you call:

- Complete model number
- All configuration information
- User's Manual
- Diagnostic menu readings

Warranty

The Watlow Series F4 is warranted to be free of defects in material and workmanship for 36 months after delivery to the first purchaser for use, providing that the units have not been misapplied. Since Watlow has no control over their use, and sometimes misuse, we cannot guarantee against failure. Watlow's obligations hereunder, at Watlow's option, are limited to replacement, repair or refund of purchase price, and parts which upon examination prove to be defective within the warranty period specified. This warranty does not apply to damage resulting from transportation, alteration, misuse or abuse.

Returns

- Call or fax your distributor or the nearest Watlow sales office for best information about returns. (See outside back cover.)
- To return directly to Watlow Winona in the U.S., first call or fax Customer Service for a Return Material Authorization (RMA) number (telephone: +1 (507) 454-5300; fax: +1 (507) 452-4507).
- Put the RMA number on the shipping label, along with on a written description of the problem.
- A restocking charge of 20% of the net price is charged for all standard units returned to stock. Returned units must be in like new condition and must be returned within 120 days of initial receipt of the product.

1

Chapter One: Introduction

Overview

Watlow's Series F4 1/4 DIN industrial ramping controllers are easy to set up, program and operate in the most demanding ramp-and-soak-processing applications. The F4 includes:

- four-line, high resolution LCD display
- guided setup and programming software
- 16-bit microprocessor

- 256 possible ramp steps in as many as 40 variable-length, nameable profiles
- six step types
- eight programmable event outputs, compressor control, boost heat/boost cool, power-out selections and a real-time clock.
- Note: the F4S has two less analog inputs and two less control outputs than the F4D.

Inputs and Outputs

Figure 1.1a — Single-Channel Series F4 (F4S_ - _ _ _ - _ _ _) Inputs and Outputs.

Figure 1.1b — Dual-Channel Series F4 (F4D_ - _ _ _ - _ _ _) Inputs and Outputs.

Sample Application: Environmental Testing with a Dual Channel F4 Using Multiple Inputs and Outputs

Overview

Andy, an engineer with the Ajax Testing Company, is running temperature and humidity tests on navigational equipment. He wants to be able to control temperature and humidity in the environmental chamber, and monitor the temperature of the equipment itself. With the Watlow Series F4 ramping controller, he can:

- program the test as a ramping profile and control it remotely;
- use boost heat and cool to maintain precise temperatures;
- record the equipment temperature on a chart recorder;
- notify the operator with a bell if process temperatures do not follow the profile;
- pause the profile if someone opens the chamber door during the test;
- set up communications with a PC later.

1. Wire

Following diagrams in the user manual, Andy connected the analog input terminals to temperature and humidity sensors, channel 1 output terminals to the heater and cooler, channel 2 outputs to the humidifier/dehumidifier, alarm output 1 to an alarm bell and retransmit output 1 to a chart recorder to track the equipment temperature. Digital output 6 and 7 controlled the boost heater and cooler, and 8 controlled the mechanical refrigeration compressor.

See the Wiring Chapter.

5. Run the Profile

Andy pressed the Profile Key and selected the test profile. He monitored the progress of the test on the display and the equipment temperature on the chart recorder.

See the Operations Chapter.

Figure 1.2 — Sample Application 1: Series F4 Dual Channel Using Multiple Inputs and Outputs.

2. Set up the F4

After checking the navigation instructions in the user manual, Andy went to the Setup Page of the software to configure the controller for the equipment and the ramping profiles. He named the alarm to make it easier to identify an alarm condition. The alarm message will appear on the Lower Display, which also informs about the progress of the test.

See the Keys, Displays and Navigation Chapter. See the Setup Chapter.

3. Customize and Name

Andy customized the Main Page so he could tell the status of the digital outputs by glancing at the controller's Lower Display (Setup Page > Custom Main Page Menu).

He also named one of the Alarms "TEMP DEV", which will make it easy to identify the alarm condition (Setup Page > Alarm Output 1 Menu). Three digital inputs, two alarms and eight digital outputs can be given 10character names.

See the Setup Chapter.

4. Program the Profile

Andy programmed the test as a ramping profile of 21 steps. To make sure the equipment is at the ambient chamber temperature, he put a Wait condition on Step 2. Step 20 is a Jump step that puts the equipment through the same heat and humidity cycle 21 times.

See the Profile Programming Chapter.

✔ NOTE:

The profile in this sample application is embedded in the Series F4 software for use as a teaching tool or a template. It is the first profile, MILSTD810D, located in the Profiles Page > Edit Profile Menu. You can change or delete this profile and later recall it through factory defaults. If you have a single-channel controller, you will see only the temperature on Channel 1. This is not the true Military Standard Test 810D.

This sample application is continued in the Operations, Profile Programming and Setup Chapters.

Setup Steps

What to do

- If the Series F4 is an independent unit, start with Step 1 below.
- If the Series F4 is already installed in and set up for a piece of equipment, proceed to Steps 4, 5, 6 and 7 below.

• If the Series F4 is already installed in a piece of equipment and the setup and profile programming functions are locked, proceed directly to Step 5 or 7.

How to do it

1	Install the controller.	See Chapter 11, Installation. (This step will not be necessary if the Series F4 is already installed in equipment.)
2	Wire the controller.	See Chapter 12, Wiring. (This step will not be necessary if the Series F4 is already installed in equipment.)
3	Set up the controller to suit your basic application.	Learn to navigate the software in Chapter 2, Keys, Displays and Navigation, and then go to Chapter 5, Setup. For background, you may also want to refer to Chapter 6, Features. (This step may not be necessary if the Series F4 is already installed in the equipment.)
4	Tune the system and set alarm set points.	See Chapter 3, Operations.
5	Set up serial communications.	See Chapter 7, Communications.
6	Program a profile.	See Chapter 4, Profile Programming.
7	Run the profile (or establish a set point for static set point control).	See Chapter 3, Operations.

The **O** Key

During all these steps, the Information Key will summon helpful definitions and setup tips. Just position the cursor next to the item you want to know more about, then press the key. Press it again to return to your task.

Chapter Two: Keys, Displays & Navigation

Information Key Answers Your Questions2.7
Main Page Parameter Table

Overview

2

This chapter introduces the user interface of the Series F4S/D controller — the displays, keys and indicator lights, and the principles of navigating the software to program profiles and change setup settings. The Series F4 is designed with userfriendly features to facilitate setup, programming and operation of the Series F4.

The four-line LCD display facilitates setup and programming, and presents informative messages about status, error and alarm conditions.

Digital inputs, digital outputs, profiles and alarms can be named for easy reference.

The Information Key summons information about the pages, menus, parameters and values, as well as error and alarm conditions if they occur.

The software is organized into five pages of menus. The Main Page gives access to the other four — Operations, Profiles, Setup and Factory. The Main Page can be customized to display user-chosen information.

Displays and Indicator Lights

Figure 2.2 — Series F4S/D Displays and Indicator Lights. (F4D shown)

Custom Main Page

The first and central page on the Lower Display is the Main Page, which shows error messages, input, output and profile status, and allows access to controller software (Go to Operations, Profiles, Setup and Factory).

The Main Page can be customized to display cho-

sen information. (To do so, go to the Setup Page, Custom Main Page Menu. See Chapter 5, Setup, for instructions.)

The following parameters will appear by default on the Main Page, unless the Main Page has been customized.

F4D

Keys and Navigation

Figure 2.4 — Series F4 Keys and Navigation.

Guided Setup

In most F4 menus, setup and programming tasks are guided. For example, once you select Analog Input 1 on the Setup Page, all parameters necessary to configure that input are linked:

- 1. Use **O O** to move the cursor to select an item in a list.
- 2. Press the Right Key **O**.
- 3. Enter the value and make a choice.
- 4. Press **O** again.
- 5. Repeat until you return to the original list.
- saves the value and proceeds to the next parameter in the series.
- saves the value and backs out of the series, and returns to the Main Page.

For initial setup and programming, we recommend that you answer all the questions in the series, entering values for all linked parameters and pressing **O** until you return to your starting point.

To edit a parameter, proceed through the series without changing values until you find the parameter you want to change. After making the change, you may back out or proceed to the end of the series.

✔ NOTE:

The Edit PID Menu (Operations Page) presents lists of parameters that can be entered and edited individually. Press either \bigcirc or \bigcirc to enter the value and return to the list.

✓ NOTE:

Make sure your setup is complete before entering profiles. Certain analog input setup changes will delete profiles.

How to Enter Numbers and Names

Many parameters require users to enter a numerical value. Alarms, digital inputs, digital outputs and profiles can be customized with easily recognized names, such as TOO HOT for an alarm, DOOR OPEN for a digital input and GLAZE 6 for a profile.

Figure 2.6 — How to Enter Numbers and Names. (F4D shown)

Information Key Answers Your Questions

There's a wealth of information about features and parameters right in the Series F4 controller. Use the Information Key to get this information.

- 1. Use the four navigation keys (**O O O O**) to position the cursor (>) next to the parameter you want to know more about.
- 2. Press the **④** key. The displayed information will assist you during setup and operation. When information takes more than four lines, the scroll bar will be filled or weighted at the end, directing you to press **○** or **○** to see the rest.
- 3. Press **0** again to return to your task.

Figure 2.7 — The Information Key. (F4D shown)

Series F4S/D Operation

The Series F4S/D controller can function as either a **static set point** controller or as a **profile** controller. The information shown on the Lower Display during operation (the Main Page) is programmable and can be customized to support both modes of operation. (See Setup Page.)

In either the static set point mode or the profile mode, the Series F4 can only be operated in a closed-loop configuration. Manual operation (openloop) mode is not allowed.

Static Set Point Control

The Series F4 is in static mode when it is not controlling a ramping profile. When in static mode:

- The Profile Indicator Light is off.
- The Upper Display shows the actual process temperature of input 1, 2 or 3 depending upon Setup Page configuration.

✓ NOTE:

All control activity stops when you enter the Setup Page, Analog Input, Digital Input, Control Output, Alarm Output, Retransmit, and Digital Output menus. • The Lower Display shows the default or userconfigured information set. See the Setup Chapter for instructions in programming the Main Page to display the information you want.

To operate the Series F4 as a static set point controller, use the navigation keys ($\bigcirc \bigcirc \bigcirc \bigcirc \bigcirc$) to select the preferred channel and adjust the set point.

Stat	ic	Set	Ρ	oint1 <u></u>	
	_		٩P		
	Adj	ust	S	Value	
<	Bac	k	>	Next	

Limits may be placed on the set point in the Set Point Low Limit and Set Point High Limit parameters (Setup Page > Analog Inputx).

Setting the set point to Set Point Low Limit minus 1 (-1) will turn control Output 1 off and display the set point as off.

```
Static Set Point1____
OFF
▲▼ Adjusts Value
< Back > Next
```

Profile Control

The main purpose of the Series F4 is to control profiles for ramp-and-soak-processing applications. The instructions below explain how to use an existing profile. To program a profile, see Chapter 4, Profile Programming.

To Start/Run a Profile

To initiate the profile mode, press the Profile Key and answer the questions that follow.

While running a profile, the Profile Status message on the lower display will keep you informed about the progress of the profile. For example, it could read like the screen at right:

✓ NOTE:

As a protective measure, all stored profiles will be cleared if you enter the Setup Page and change values in the Analog Input 1, 2, 3 menus —specifically, the Sensor, Sensor Type, Decimal, Scale (for process inputs), and Set Point High and Low Limits. Pop-up messages will warn that the profiles will be erased from the controller's memory.

✓ NOTE:

You must configure the software for your inputs and outputs before programming a profile. See the Setup Chapter.

✔ NOTE:

You must program a profile or use the pre-programmed MILSTD810D profile before running it. See the Profile Programming Chapter.

Check the configuration of the controller on the Setup Page before starting and running a profile (if the Setup Page is not locked). Make sure the settings are appropriate to the profile: input sensor ranges and limits, digital inputs and outputs as events, guaranteed soak band, response to power out and Celsius or Fahrenheit scales. If the Setup Page is accessible, failure to check the configuration before running a profile could result in damage to equipment and/or property, and/or injury or death to personnel.

Start Profile:_____ MILSTD810D..... ALUMINUM >Glaze 8 O

Start:				
Step	1	Autos	start	
>Step	2	Ramp	Time	
Step	3	Ramp	Time	

Glaze 8 Running. Step 2 Remain 00:10:30

✔ NOTE:

While a profile is running, the controller will not recognize digital inputs that are programmed to start a profile. Such digital inputs will be recognized only while the controller is in the static set point mode.

✓ NOTE:

While a profile is running, profiles can be either created or renamed only while a profile is running. All other pages and menus can be entered only during Static Set Point Control mode.

To Hold a Running Profile

- **1. Press the Profile Key** (2) while running a profile. The Profile Action Menu appears.
- **2. Choose to Don't Hold, Hold or Terminate the profile.** (Default is to Don't Hold.) If you choose to hold the profile, the Main Page reappears, and the Profile Status message reads "Profile X holding." The Profile Indicator Light is off.

If you do not make a choice when the Profile Action Menu appears, the profile continues running and the profile indicator light stays on.

To Resume a Profile on Hold

- **1. Press the Profile Key (a)** while a profile is holding. The Resume Profile Menu appears.
- 2. Choose to Continue Holding, Resume or Terminate the profile.

If you do not make a choice, the profile continues holding and the Profile Indicator Light stays off.

```
Hold Profile:_____
Don't Hold
>Hold
Terminate
```

✔ NOTE:

While profiles are on hold, the step set point value can be adjusted using the Static Set Point parameter on the Main Page.

Resume Profile:_____ >Continue Holding Resume Terminate

✓ NOTE:

When a profile is resumed during a Ramp step, the controller uses the Static Set Point from the Main Page to calculate the rate of change needed to get to the set point at the end of the step. When a profile is resumed in a soak step, the new set point value will be used as the soak value for the time remaining in the step.

To Terminate a Running/Holding Profile

- **1. Press the Profile Key** while a profile is **running.** The Profile Action Menu appears.
- **2. Choose to Continue, Hold or Terminate** the profile. (Default is to Continue.) If you choose to terminate, the profile ends with all outputs off. The set point on the Main Page reads off.

If you do not make a choice when the Profile Action Menu appears, the profile continues as it was running or holding.

```
Hold Profile:_____
Don't Hold
Hold
>Terminate
```

✔ NOTE:

The Profile Status message takes precedence over all other information except errors, alarm messages and input status. Errors and alarm messages always take precedence over Profile Status.

The Profile Key:

- initiates the ramping profile mode;
- initiates the Hold-profile state;
- initiates the Resume-profile command;
- initiates the Terminate-profile command.

The Profile Key functions only from the Main Page. It will not function from any of the other pages — Operations, Profile, Setup or Factory.

Alarm Set Points

The Series F4 includes two alarm outputs, which can be programmed as process or deviation alarms.

Process alarms notify the operator when process values exceed or fall below Alarm Low and Alarm High Set Points. Deviation alarms notify the operator when the process has deviated from the set point beyond the deviation limits. For more information, see the Features Chapter. To set up the alarms, see the Setup Chapter.

Alarm set points are the points at which alarms switch on or off, depending on the alarm setting. Alarm set points can be viewed or changed in the Alarm Set Point Menus (Operations Page).

The Alarm High Set Point defines the high temperature that, if exceeded, will trigger an alarm. This temperature must be higher than the alarm low set point and lower than the high limit of the sensor range.

The Alarm Low Set Point defines the low temperature that, if exceeded, will trigger an alarm. This temperature must be lower than the alarm high set point and higher than the low limit of the sensor range.

✓ TIP:

You may want to set up the alarms with names that will identify the alarm conditions. See the Setup Page.

To Clear an Alarm or Error

In an alarm condition, an alarm message will appear on the Main Page (if this option has been selected on the Setup Page). To silence it, move the cursor to the alarm message and press the Right Key **O** . A pop-up message will confirm the silencing of the alarm, and the indicator light will go off.

When the condition causing the error or alarm is corrected, return to the error or alarm message on the Main Page, and press the Right Key again. A pop-up message confirms the alarm is unlatched.

Auto-tune PID

In autotuning, the controller automatically selects the PID parameters for optimal control, based on the thermal response of the system. In the Series F4, five sets of PID values are available for each channel of the controller: sets 1 to 5 for channel 1, and sets 6 to 10 for channel 2. Default PID values exist for all PID sets, although these values typically do not provide optimal control. PID values can be auto-tuned or adjusted manually. When autotuning is complete, the PID values will be stored in the Edit PID Menu.

✔ NOTE:

PID Set 1 for Channel 1 and PID Set 6 for Channel 2 are used in the Static Set Point mode.

Autotuning Procedure

Autotuning cannot be initiated while a profile is running. It can only be initiated in the static set point control mode.

1. Before initiating auto-tune, go to the System Menu (Setup Page), and set the Channel 1 or 2 Autotune Set Point to the percentage of set point you choose to begin with. This percentage is based on your knowledge of the system and how much overshoot or undershoot there is likely to be in on-off control.

In the Custom Main Page, select to display Tune Status 1 and Tune Status 2. This displays Tune Status in the Main Page.

- 2. Go to the Main Page and set the static set point.
- 3. Go to the Autotune PID Menu (Operations Page) and choose the channel to auto-tune and the PID set in which to store the settings. A message will be displayed on the Main Page during the autotuning process. (Auto-tune cannot be initiated when a profile is running. It can only be initiated in the static set point mode.)
- 4. When autotuning is complete, the controller will store the values for optimum control in the PID set specified.

✔ NOTE:

While the controller is autotuning, profiles cannot be run and only the Profiles Page and Operation Page of the software can be entered.

CAUTION: Choose an auto-tune set point value that will protect your product from possible damage from overshoot or undershoot during the autotuning oscillations. If the product is sensitive, select the auto-tune set point very carefully to prevent product damage.

For additional information about autotuning and proportional, integral and derivative control, see the Features Chapter.

Edit PID

Edit PID is useful when Auto-tune PID does not provide adequate control. Each of the PID parameters can be adjusted manually:

Proportional Band: Define a band for PID control, entered in degrees or units. Lower values increase gain, which reduces droop but can cause oscillation. Increase the proportional band to eliminate oscillation. **Integral (Reset):** Define the integral time in minutes per repeat; define reset in repeats per minute. Set repeats per minute if units are U.S.; minutes per repeat if units are SI.

Derivative (Rate): Define the derivative (rate) time in minutes. Large values prevent overshoot but can cause sluggishness. Decrease if necessary.

Dead Band: Define the dead band in degrees or units. Heating dead band shifts the set point down. Cooling dead band shifts the set point up. For more information, see the Features Chapter.

Manual Tuning Procedure

- 1. Apply power to the Series F4 and enter a set point. Go to the Operations Page, Edit PID Menu and begin with Proportional Band set to 5; Integral (Reset) set to 0; Derivative (Rate) set to 0; and Autotune set to Tune Off.
- 2. Start manual tuning by entering the desired set point and let the system stabilize. Once the system stabilizes, observe the value of Input 1 on the Main Page. If the Input 1 value fluctuates, increase the proportional band setting until it stabilizes. Adjust the proportional band in 5° to 10° increments, allowing time between adjustments for the system to stabilize.
- 3. Once Input 1 has stabilized, observe the percent power on the Main Page. It should be stable, $\pm 2\%$. At this point, the process temperature should also be stable, but it will exhibit droop (stabilized below set point). The droop can be eliminated with reset or integral.
- 4. Start with a reset setting of 0.01, and allow 10 minutes for the process temperature to come up to set point. If it has not, increase the setting to 0.05 and wait another 10 minutes. After this, double the reset setting and wait another 10 minutes until the process value equals the set point. If the process becomes unstable, the reset value is too large. Decrease the setting until the process stabilizes.
- 5. Increase Derivative/Rate to 0.10 minute. Then raise the set point by 20° to 30°F, or 11° to 17°C. Observe the system's approach to the set point. If the load process value overshoots the set point, increase Derivative/Rate to 0.50 minute.

Raise the set point by 20° to 30°F, or 11° to 17°C and watch the approach to the new set point. If you increase Derivative/Rate too much, the approach to the set point will be very sluggish. Repeat as necessary until the system rises to the new set point without overshooting or approaching the set point too slowly.

For additional information about manual tuning and proportional, integral and derivative control, see the Features Chapter.

Multiple PID Sets

Environmental chambers, ovens and furnaces typically have different thermal requirements when they operate at high and low temperatures or pressures. To accommodate varying thermal requirements, the F4 is capable of storing five different PID sets for each channel. One set for each channel can be chosen in each profile step.

For example, a controller in an environmental chamber with PID settings optimized for control at subzero temperatures may not control well when the set point is set to temperatures above the boiling point of water. With the F4, one PID set could be used for subzero operation and another set for temperatures above boiling.

Multiple Tuning Procedure

- 1. To auto-tune a single PID set, begin by setting the static set point on the Main Page.
- 2. Go to the Autotune PID Menu (Operations Page), and choose a channel and a set. Autotuning begins when you select the set. The Main Page displays information about the autotuning process when Tune Status is selected in the Custom Main Page.
- 3. When autotuning is finished, proceed with another PID set.

In the example above, the user would first autotune a PID set for subzero operation, and then another for operation at boiling temperatures. When programming a profile, the user could then select a different PID set for each step, depending on the thermal requirements.

✔ NOTE:

Autotuning cannot be done while running a profile. It can only be initiated when the controller is in the Static Set Point Control mode.

Cascade

Cascade control is available on the Series F4 controllers. For background information about cascade control, see the Features Chapter.

Select cascade control through the Analog Input 3 Menu (Setup Page) and choose Process Cascade or Deviation Cascade. To set the range for the Process Cascade Inner Loop set point, use Low and High Range settings. These are independent of the Channel 1 set point. Deviation Cascade uses Deviation Low and High settings that are referenced to the Channel 1 set point.

Deviation Cascade is used in applications with large set point ranges or where limiting heating or cooling equipment temperatures is required.

When tuning a cascade system, the inner loop must be tuned first. The inner loop comprises outputs 1A and 1B and the Analog Input 1 sensor, which usually measures the energy source temperature. The output device controls a power switching device, which in turn switches the heating and cooling. The set point for the inner loop is generated by the outer loop. For Process Cascade, this will have a range between the Cascade Low Range and Cascade High Range.

Cascade Setup Procedure

1. First, configure Analog Input 3, Cascade Low Range and Cascade High Range.

Go to the Analog Input 3 Menu (Setup Page). Choose Process or Deviation Cascade. Deviation Cascade references Channel 1 set point allowing a range above and below the current control set point. For Process Cascade control of a heat/cool or cool only system, set the Cascade Low Range to a value slightly lower than the lowest temperature desired in the chamber. For heat-only systems, set the Cascade Low Range to a value slightly lower than the ambient temperature; otherwise the heat output will never turn fully off.

For heat/cool or heat only systems , set the Cascade High Range to a value slightly higher than the highest temperature desired in the chamber. For cool-only systems, set the Cascade High Range to a value slightly higher than the ambient temperature; otherwise the cooling will never fully turn off.

2. Next, configure the controller to tune and display data for the outer loop. To view Inner Loop Set Point in the upper display, go to the Setup Page, Custom Main Page Menu, select the Inner Set point as one of the parameters, P1 to P16, to be displayed in the Main Page.

To also view Analog Input 3 in the upper display, go to the Setup Page, Process Display Menu, and choose Alternating. Under Set Display Time, choose a duration for the display of the Input 1 and Input 3 variables.

Cascade Autotuning Procedure

- 1. Go to Setup Page, Custom Main Page Menu. Choose Tune Status 1 and Tune Status 2 to appear as 2 of the 16 parameters that can be displayed on the Main Page. The Main Page will now display the status of the autotuning process.
- 2. Autotune the inner loop. Go to the Autotune PID Menu (Operations Page), and select Cascade Inner-loop. Choose Cascade Inner Loop PID Set 1 to 5, where PID values will be stored after autotuning. Autotuning begins when you choose the PID set. While autotuning, the F4 controller will control the energy source in an on-off mode to a temperature equal to the Cascade High Range setting x Channel 1 Autotune Set Point. For best results, use proportional control only on the inner loop.
- 3. Next, autotune the outer loop. Go to the Autotune PID Menu (Operations Page). Choose Cascade Outer Loop, then choose Outer Loop PID set 1 to 5, where PID values will be stored after autotuning. Autotuning begins when you choose the PID set. While autotuning, the outer loop will be controlled in an on-off mode at a set point equal to static set point x Ch 1 Autotune Set Point. In most cases, the autotuning feature will tune for acceptable control. If not, manually tune the outer loop (step 4 below). Before manually tuning, record the values generated by the autotuning feature.
- 4. To manually tune the outer loop, go to the Edit PID Menu (Operations Page). Choose Cascade Outer Loop, then choose Outer Loop PID set 1 to 5. Begin manual tuning by setting the Proportional Band to 5, Integral (Reset) to 0, and Rate to 0. Establish the desired set point and let the system stabilize. When the system stabilizes, watch the Inner Loop Set Point on the Main Page. If this value fluctuates, increase the proportional band until it stabilizes. Adjust the proportional band in 3° to 5° increments, allowing time for the system to stabilize between adjustments.
- 5. When Input 1 has stabilized, watch the percent power on the Main Page. It should be stable, $\pm 2\%$. At this point, the process temperature should also be stable, but it will exhibit droop (stabilized below set point). The droop can be eliminated with Integral (reset).
- 6. Start with an integral setting of 99.9 minutes, and allow 10 minutes for the process temperature to come up to set point. If it has not, decrease the setting by half and wait another 10 minutes. Then halve the setting again and wait another 10 minutes until the process value equals the set point. If the process becomes unstable, the integral value is too small. Increase it until the process stabilizes.

Sample Application: Environmental Testing, Running a Profile

Andy, an engineer with the Ajax Testing Company, is running temperature and humidity tests on navigational equipment. He runs the test profile, Military Standard Test 810D, having already set up the controller and programmed the profile.

In Step 4, the temperature in the chamber exceeded the Alarm 1 setting. This triggered the alarm, causing the indicator light on the front panel (next to the bell-shaped icon) to light up and a message to appear on the lower display: "TEMP DEV High."

Because Alarm 1 was set up as a latching alarm (Setup Page), Andy had to clear it manually. First he corrected the alarm condition by widening the gap between low and high deviation alarm settings on the Operations Page. He then unlatched the alarm by returning to the Main Page alarm line and pressing the Right Key **O** again.

If your Series F4 is a single-channel controller, you will see only the temperature on Channel 1. This is **not** the true Military Standard Test 810D.

✓ NOTE:

This profile is embedded in the Series F4 as a teaching tool and a template. Go to the Edit Profile Menu (Profiles Page) and look for MILSTD810D.

RUN

Andy presses the Profile Key , moves the cursor to "MILSTD810D" on the Run Profile Menu, then presses the Right Key . He wants to begin at Step 1, so he presses to select that step. The Profile Status Message (on the Lower Display) now says: "MILSTD810D Running. Step 1 Remains: XX:XX."

```
Start Profile:_____
>MILSTD810D.....
ALUMINUM
Glaze 8
```

HOLD

When the alarm occurred, Andy put the profile on hold while he corrected the Alarm Set Points.

Hold Profile:_____ Don't Hold >Hold Terminate

MILSTD810D Holding. Step 1 Remains 00:01:40

RESUME

After clearing the alarm, Andy entered the command to resume the profile.

```
Resume Profile:_____
Continue Holding
>Resume
Terminate
```

Troubleshooting Alarms and Errors

Indication	Probable Cause(s)	Corrective Action		
 Power Displays are dead. Power to unit may be off. Fuse may be blown. Breaker may be tripped. Safety Interlock door switch, etc., may be activated. Separate system limit control may be latched. Wiring may be open. Input power may be incorrect. 		 Check switches, fuses, breakers, interlocks, limits, connectors, etc. for energized conditions and proper connection. Measure power upstream for required level. Check part number for input power required. Check wire size. Check for bad connections. 		
Communications • Unit will not communicate.	 Address parameter may be incorrectly set. Baud rate parameter may be incorrectly set. Unit-to-unit daisy chain may be disconnected. Communications wiring may be reversed, short or open. EIA-485 converter box may be incorrectly wired. Computer communications port may be incorrectly set up. Communications software setup or address may be incorrect. Protocol or parity may be wrong, should be 8, n, 1. Application software not working properly. May need termination and pull-up and pull-down resistors. 	 Check Communications Setup Menu and set to correct address. Check Communications Setup Menu and set to correct baud rate. Look for a break in the daisy chain. Verify correct connections and test wiring paths. Check converter box wiring and its documen- tation. Reconfigure computer's communications port setup and verify that communications are okay. Check the communication card documentation for setable variables and operational testing. Restart communications software and check for settings agreement. Verify the communica- tions bus is active. Verify operation with Watlow communications tool. 		
Alarms • Alarm won't occur.	 Alarm output may be off. Alarm set points may be incorrect. Alarm sides may be incorrect. Controller may be in diagnostics mode. 	 Configure output as an alarm. Check alarm set points. Check the alarm sides setting. Check the alarm type setting. 		
 Alarm won't clear. (To clear the alarm, correct the alarm condition. If the alarm is latched, press ○ with the cursor at the alarm message on the Main Page.) 	 Alarm may be latched. Move cursor to alarm message. Press O. Alarm set points may be incorrect. Alarm hysteresis may be incorrect. Input may be in error condition. 	 Check the alarm logic for compatibility with system peripherals and annunciators. Check the power limit setting. Check the operation mode. Check the alarm output function. Check the °C and °F setting. Check the calibration offset value. Set it to a lower level. 		

Indication Prok	bable Cause(s)	Corrective Action
Input Errors (Upper Display shows error code for input 1 only. Lower Display shows error message. Alarm Output Indicator is lit.)	• Input is in error condition.	• Check sensor connections.
Upper	 Check sensor connections and sensor wiring. 	 Check sensor connections and sensor wiring.
Upper A-dh , Lower !Input x (1 to 3) AtoD+	• Input type may be set to wrong sensor or may not be calibrated.	• Check the Sensor parameter to match the sensor hardware.
Upper [SEnto] Lower Input x (1 to 3) Sensor-	• Power may be incorrect.	Measure power upstream for required level. Check part number for power re- quirements
Upper [5Enh] Lower !Input x (1 to 3) Sensor+	• The open loop detect feature shows a broken sensor.	 Check sensor function. The Open Loop Detect parameter indicates it may be broken
Upper ALod Lower !Timeout	• The Calibration Offset parameter is se much too high or low.	 Check the Calibration Offset parameter value. Set it to a lower level.
System Errors (Upper Display shows error numbers. Lower Display mes- sages indicate cause and ac- tion to take.)	• Input is in error condition.	• Check sensor connections.
 Input 1 Module Error! Only single-channel modules supported. 	• Input 2-3 module in input 1 slot.	• Move module to correct input slot.
• Input 1 Module Error! Only dual-channel modules supported	• Input 1 module in input 2-3 slot.	• Move module to correct input slot.
Retransmit 1 Module Error! Only process modules supported	• Wrong module in retransmit 1 slot.	• Replace incorrect module with retransmit module.
Retransmit 2 Module Error! Only process modules supported	• Wrong module in retransmit 2 slot.	• Replace incorrect module with retransmit module.
Cannot identify: Modify: Re- place module	• Component failure.	• Remove the module just installed and
 Module change. Defaults will occur. Accort with any key 	• Module changed.	Press any key. All parameters will default
 First power-up. Parameters 	• Firmware upgrade.	• Wait until initialization is done.
 Firmware change. Parameters are initializing. 	• Firmware upgrade.	• Wait until initialization is done.
Fatal Errors (Controller shuts		
down.) • Checksum Error!, Parameter	• Loss of power during memory setup.	• Turn the controller off, then on again.
memory. Checksum Error!, Unit config 	• Loss of power during memory setup.	• Turn the controller off, then on again.
Checksum Error!, Profile mem	• Loss of power during memory setup.	• Turn the controller off, then on again.
RAM Test Failed! Return con- troller to the Fastery	• Component failure.	Call your Watlow distributor or represen- tative
 Flash Memory Failed. Return controller to the Factory. 	• Component failure, loss of power during download.	 Call your Watlow distributor or represen- tative.

Profiles Page Parameter Table4.12

Overview

This chapter explains how to program a ramp-andsoak profile so that it will be stored in the Series F4 memory.

- The first section explains profiles, steps and step types.
- The second section explains how to name and program a ramping profile. The Series F4 presents a sequence of questions that prompt you to define the steps and the step properties. While reading this section, refer to the profile already embedded in the Series F4 software. You can use this profile, Military Standard Test 810 (MILSTD 810D), as a template and learning tool.
- The third section explains how to edit and delete an existing profile. In the Series F4, you

✓ NOTE:

For more information about how parameter settings affect the controller's operation, see the Features Chapter.

✔ NOTE:

If your Series F4 is a single-channel controller, you will see only the temperature on Channel 1 of the embedded profile. This is not the true Military Standard Test 810D. choose from a list of the steps and their parameters, much like in previous controllers.

• You will also find a User Profile Record to use to record the steps and parameters for your profiles.

If you receive this controller as a separate unit, you will have to install, wire and configure the Series F4 before you set up a ramping profile.

If you receive this controller already installed in an environmental chamber, furnace or other equipment, continue with this chapter. You will not have to configure the controller if the manufacturer has done this for you. You should check the Setup Page in the controller software for settings of relevant inputs and outputs.

✔ NOTE:

Make sure your controller inputs are properly configured before entering profiles. Analog Input setup changes may delete profiles.

What Is a Ramping Profile?

A **ramp** is a programmed change from one set point to another. A **soak** maintains the set point over a period of time.

A **profile** is a set of instructions programmed as a sequence of steps. The controller handles the profile steps automatically, in sequence. As many as 40 different profiles and a total of 256 steps can be stored in the Series F4's non-volatile memory.

The 256 steps are grouped by profile. So, one profile could have 256 steps; or 39 profiles could have 6 steps and one could have 22; or 32 profiles could have eight steps each. The maximum number of steps is 256, and the maximum number of profiles is 40.

Figure 4.2 — An eight-step profile, as it might be logged on a chart recorder.

Step Types — Building Blocks of Profiles

Six types of steps are available in the Series F4. They are the building blocks of ramping profiles.

Use the six step types to create simple or complex profiles involving all inputs and outputs. The Series F4 prompts you to define each step's properties, listed below.

- Autostart
- Ramp Time
- Ramp Rate
- Soak
- Jump
- End

Autostart

Autostart pauses a profile until the specified date or day, and time (of a 24-hour-clock). Define the Autostart by choosing:

- 1. Day (of the week) or Date,
- 2. Time

Note: To invoke an Autostart step in a profile, you must activate the profile via the Profile Key and select the Autostart step.

Ramp Time

Ramp Time changes the set point to a new value in a chosen period of time. Ramp Time is the same for both channels of a dual-channel controller. Define the Ramp Time step by choosing:

- 1. Wait for an event or process value;
 - (Wait for Events are set up in the Setup Page.)

- 2. Event outputs to turn on or off (if digital outputs are set up as events in the Setup Page);
- 3. Time (in hours, minutes and seconds);
- 4. Channel 1 Set Point;
- 5. Channel 2 Set Point (if dual channel);
- 6. PID set (one of five sets of heat/cool PID parameters per channel, pre-defined in the Operations Page);
- 7. Guaranteed Soak (requires the actual process value to stay within the Soak Band as set in the System Menu).

Ramp Rate

Ramp Rate (for single channel only) changes the set point to a new value at a chosen rate. Define the Ramp Rate step by choosing:

- 1. Wait for an event or process value;
 - (Wait for Events are set up in the Setup Page.)
- 2. Event outputs to turn on or off (if digital outputs are set up as events in the Setup Page);
- 3. Rate (units per minute);
- 4. Channel 1 Set Point;
- 5. PID set (one of five sets of heat/cool PID parameters, pre-defined in the Operations Page);
- 6. Guaranteed Soak (requires the actual process value to stay within the Soak Band as set in the System Menu).

Soak

Soak maintains the set point from the previous step for a chosen time in hours, minutes and seconds. Define the Soak step by choosing:

1. Wait for an event or process value;

(Wait for Events are set up in the Setup Page.)

- 2. Event outputs to turn on or off (if digital outputs are set up as events in the Setup Page);
- 3. Time;
- 4. PID set (one of five sets of heat/cool PID parameters per channel, pre-defined in the Operations Page); or
- 5. Guaranteed Soak (requires the actual process value to stay within the Soak Band as set in the System Menu).

Jump

Jump initiates another step or profile. Define the Jump step by choosing:

- 1. Profile to jump to;
- 2. Step to jump to; and
- 3. Number of Repeats.

✓ NOTE:

If a **power out condition** occurs during a profile and more than 20 jump steps are stored in the F4's Profile Program memory, the controller will terminate the profile and turn off all outputs if Continue, Hold or Terminate was selected as the Power Out action. If Profile Reset or Go to Idle Set Point was selected, the controller will take those actions. A pop-up message will warn of this when the 21st jump step is programmed

End

End terminates the profile in a chosen state. All profiles must have an End step. It cannot be deleted or changed to another step type. Define the End by choosing:

• End with Hold, Control Off, All Off or Idle end state.

Another Option: Wait For

Wait For is not a step type, but Ramp Time, Ramp Rate and Soak steps can be programmed to wait for events and processes. This means the wait conditions must be satisfied before the time clock and the step activity proceeds.

If the step is to wait for an analog input, the actual

process value must arrive at or cross the specified value before the step proceeds.

Digital inputs must first be configured in the Setup Page as Wait for Events, with the condition to be met also specified. Then, to wait for this digital input, you must specify On, meaning the condition as configured in the Setup Page, or Off, meaning the opposite of that condition.

Profile Plan Checklist

- **1. Configure the controller** (Setup Page) to provide the right foundation for the profile:
 - □ Set the appropriate input sensor ranges and limits (Input Menus).
 - Establish digital inputs and outputs as events if required (Digital Input and Output Menus).
 - □ Set the guaranteed soak band (System Menu).
 - □ Decide the controller response to a power-out situation (System Menu).
 - □ Choose Celsius or Fahrenheit (System Menu) scale.
 - □ If Setup Page values have not been recorded, note them on the Setup Page Parameter Record in the Setup Chapter.

2. Check the Operations Page:

- □ If defaults are not acceptable, establish PID values (through the Autotune or Edit PID Menu).
- □ Set the alarm set points (Alarm Set Points Menu).
- **3. Plan the profile on paper.** The User Profile Record (later in this chapter) will give you a framework for your plan.
- **4. Program the profile.** Make sure the User Profile Record is an accurate record of the program.
- **5. Store the Setup Page Parameter Record** along with the User Profile Record to document your programmed settings.
How to Program a New Profile

The Series F4 uses a question-and-answer format to prompt you to define the steps and step types of a new profile. Here's how:

1. Go to the Profiles Page.

Move the cursor to Go to Profiles (at the bottom of the Main Page), then press the Right Key \bigcirc .

2. Create a new profile.

Press **O** .

3. Name the profile.

Unless the equipment manufacturer has locked out this function, you can name your profiles for easy reference. (Names can have up to 10 characters.) To name a profile,

- Press to enter the name space and the first position.
- Press the Up or Down Key ○ to scroll through the alphabet and choose the letter or number. (See Chapter 2, Navigation, for the character selections available.)
- Press O to move to the next position.
- Continue until the name is complete, or until you move through the name space into the next screen.
- Enter O to save the name of the profile. This name will be stored in the Series F4's memory and will appear on the Main Page when you run the profile.

4. Choose the step type.

There are six step types, each of which must be defined through different parameters. (See "Step Types," earlier in this chapter.)

5. Define each step type.

The Series F4 prompts you to define the parameters of each step type. For example, when you choose Ramp Time, the Profile Guide asks:

- if you want the step to wait for an event or process input before starting;
- whether events outputs are on or off (digital outputs must be set up as events in the Setup Page);

Choose	to	Name:
No		
>Yes		

Ente	r Profil	е	Name:_
ALUM	<u>INUM8</u>		
	Adjusts	Ch	ar
<	Back	>	Next

Choose	Step1	Туре:	
Autos	tart		
>Ramp	Time		
Ramp	Rate	▼	
Choose	to wa	i + •	

>Step does not wait
Step waits for...

- how much time it will take to reach set point;
- what the set point is;
- which PID set to activate; and
- whether you want a guaranteed soak.

Continue defining step types until your profile is complete. The last step must be an End step.

6. Choose the end-state.

All profiles end with an End step, which is preprogrammed into the new profile. Choose:

- Hold set point and event outputs;
- Control off, set point off, event output status maintained;
- All Off (control outputs and event outputs) or
- Idle, with each channel at user-specified set points. Event output status maintained.

7. Save your settings.

When exiting the Profiles Page, choose whether to save profile data ${f O}$ or restore values ${f O}$.

✔ NOTE:

The final step of every profile is End. You cannot delete an End step or change it to another type, but you can insert new steps before it.

Enter	Ramp	Time:	
00:0	0:01	(H:M:S)	
\mathbf{A}	Adjus	ts Digit	
$\langle \rangle$	Save	Changes	

Get Information from the ${\ensuremath{\Theta}}$ Key

If you do not know a term, press the **•** Key when the cursor points to the word in the display text. Or check the glossary in the Appendix of this user manual.

i Ramp Time: A step type that changes the set point to a new value in a user-chosen period of time.

How to Edit a Profile

To change one or more parameters in any step of a profile, choose Edit Profile on the Profiles Page.

1. Go to the Profiles Page.

Move the cursor to Go to Profile (at the bottom of the Main Page), then press $oldsymbol{O}$.

2. Choose to edit a profile.

Press **O** .

3. Choose the profile you want to edit.

Press O .

4. Choose how you change the profile.

Choose whether you want to insert a new step, edit a specific step or delete a step.

To edit a step:

- Select the number of the step you wish to edit from a list of steps and step types.
- The next screen presents a list of all possible step types. The cursor will be positioned on the current step type. To keep it, press and make your changes to the properties listed on succeeding screens.
- If you choose to change a Step Type, the Series F4 will prompt you to program all necessary parameters.

To insert a step:

Move the cursor to the number of the step that the new step will precede. Press • . The Series F4 will prompt you to program all necessary parameters of the new step. Inserting a step changes the numbers of all steps that follow.

To delete a step:

Move the cursor to the number of the step to be deleted. Press • . Deleting a step changes the numbers of all steps that follow.

A Jump Step that jumps to an End Step cannot be deleted.

✔ NOTE:

Inserting a step changes the numbers of all steps that follow.

A Sample Application: Environmental Testing

Programming a Profile

This profile is embedded in the Series F4 software for use as a teaching tool and as a template. To see how it is programmed in steps, and how each step is defined, go to the Profiles Page, choose Edit Profile and open MILSTD 810D.

If your Series F4 is a single-channel controller, you will see only the temperature on Channel 1. This is NOT the true Military Standard Test 810D.

To test its customers' navigational equipment,

Ajax Testing Co. selected a version of Military Standard Test 810D, which is often used to test navigational or other military equipment under hot, humid conditions. The full test requires a two-channel controller to manipulate both temperature and humidity in an environmental chamber.

Andy planned his profile on the User Profile Record,

after checking the Setup Page to make sure the controller's inputs, outputs, limits and ranges were configured properly. Andy then programmed the profile into the Series F4.

Military Standard 810D

Step 1:	Ramp Time	Initialize the set point for channels 1 and 2.
Step 2:	Soak	Wait for channels 1 and 2 process values to reach their set points before the test proceeds.
Step 3:	Soak	To ensure that the equipment temperature has stabilized, expose the equipment in the chamber to a temperature of 88°F and an RH of 88% for five hours.
Steps 4 to 11:	Ramp Time	The test calls for a programmed increase in temperature and decrease in relative humidity over a period of eight hours.
Step 12:	Soak	Expose the equipment in the chamber to a temperature of 105°F and an RH of 59% for three hours.
Steps 13 to 19:	Ramp Time	The test calls for a programmed decrease in temperature and increase in relative humidity over a period of seven hours.
Step 20: Step 21:	Jump End	Jump to step 3 and repeat steps 3 to 20 twenty times. End the profile and turn off all outputs.

Step	Step	Date/Day,	Wait	Se	et E	ver	nts					Time	Rate	Set	Set	PID	Guar.	Jump to	Step	Repeats	End

Frequently Asked Questions About Profiles

1. Why should I check the Setup Page before programming a profile?

Complex, sophisticated profile control is possible with the Series F4's two or three analog inputs, four digital inputs, four control outputs (two for a single-channel controller), two alarm outputs, two retransmit outputs and eight digital outputs, but they must be configured correctly. Don't assume that the controller has been set up correctly for the profile you want to program and run. Checking the Setup Page first will save time.

2. Why can't I program a Ramp Rate step on Channel 2?

Ramp Rate is available only on single-channel controllers.

3. Why can't I set the Channel 2 parameters?

Channel 2 parameters do not appear in singlechannel controllers, or Input 2 is Off in a dualchannel controller.

4. Why can't I adjust the set point to get the value I want?

Check the configuration of the inputs (Setup Page) and the set point limits (Setup Page).

5. Why don't the digital inputs appear as Wait for conditions?

They must first be configured as events in the Setup Page.

6. Why can't I delete a particular step of my profile?

You cannot delete a step that another step jumps to, or a step that is an End step.

7. Why can't I delete the End step?

Because every profile must have an End step, and this End step is programmed into the profile. If you wish to add a step before the end, use the Insert Step command under the Edit Profiles Menu.

8. How do I start or run a profile?

You must be on the the Main Page to run a profile. Press the Profile Key, select the profile you want to run and choose the step you want to start on.

9. I just programmed the profile, but when I press the Profile Key nothing happens. What's wrong?

You must return to the Main Page before running a profile. The Profile Key does not function from any other page but the Main Page.

10. How do I know which profile is running?

When a profile is running, the profile name and current step number is displayed on the Main Page. You may have to scroll up or down to find this information.

11. Why can't I access certain pages, menus or parameters?

The parameters you are looking for may not be available in your model of controller.

The OEM that installed the F4 may have locked users out of certain pages and menus.

The F4's software may have been locked by a supervisor or someone else at your facility.

If a profile is running, you can enter only the Profiles Page.

WARNING:

Check the configuration of the controller on the Setup Page before starting and running a profile (if the Setup Page is not locked). Make sure settings are appropriate to the profile. If the Setup Page is accessible, failure to check the configuration before running a profile could result in damage to equipment and/or property, and/or injury or death to personnel.

✔ NOTE: Two sets of Modbus registers contain profile information: In edit mode, the number of the profile being edited is at 4000, and the number of the step being edited is at 4001. When the profile is running, the number of the profile being run is at 4100, and the number of the step being run is at 4101. All run addresses are read only.

*****✔ NOTE:

If a **power out condition** occurs during a profile and more than 20 jump steps are stored in the F4's Profile Program memory, the controller will terminate the profile and turn off all outputs if Continue, Hold or Terminate was selected as the Power Out action. If Profile Reset or Go to Idle Set Point was selected, the controller will take those actions. A popup message will warn of this when the 21st jump step is programmed

 \checkmark NOTE: Two sets of Modbus registers contain profile information: In edit mode, the number of the profile being edited is at 4000, and the number of the step being edited is at 4001. When the profile is running, the number of the profile being run is at 4100, and the number of the step being run is at 4101. All run addresses are read only.

✓ NOTE: For more information about how parameter settings affect the controller's operation, see the Features Chapter.

Custom Main Page Parameter Record5.3	
Sample Application5.4	
Setup Page Map5.6	
Setup Page Parameter Table5.7	
Setup Page Parameter Record	6

Overview

This chapter presents information about configuring the controller software through the Setup Page. This is where you:

- indicate what hardware the input and output pins will be connected to;
- indicate how the inputs and outputs will function (Some of the inputs, outputs and functions may not be visible, depending on the model number of your controller);
- choose Celsius or Fahrenheit scales;
- make other choices about the display of information on the Main Page and in the Upper (LED) Display; and
- set up computer communications with the controller.

Many control features are explained in greater depth in the Features Chapter.

To reach the Setup Page from the Main Page, move the cursor to Go to Setup, then press the Right **O** Key.

✓ NOTE:

If the Series F4 is already installed in an environmental chamber, oven, furnace or other equipment, most parameters will already be configured and access to the Setup Page may be limited (locked).

Setup Guidelines

Setup Page parameters affect many areas of the controller's function:

- which parameters and functions are visible in other pages;
- the way the controller responds to your application; and
- the way information is displayed on the Main Page.

Setting up the controller properly will provide a sound foundation for settings in other pages.

Parameter Setup Order

Initial configuration of the Series F4 is best done in the following order:

- 1. Go to the System Menu (Setup Page). Here you will indicate:
 - the current time and date;
 - preference of PID units U.S. (Reset, Rate) or SI (Integral, Derivative);
 - preference of Celsius or Fahrenheit scales;
 - whether or not to display these units in the controller's Upper Display,

✓ NOTE:

To see how all the pages, menus and parameters are grouped, see the software map on the inside back cover of this manual.

✓ NOTE:

For more information about how parameter settings affect the controller's operation, see the Features Chapter.

- the guaranteed soak band for each channel;
- · open-loop detection warnings on or off; and
- profile-power outage actions.

2. Go the Setup Page and define all inputs, outputs and alarms:

- Analog Input x (1 to 3);
- Digital Input x (1 to 4);
- Control Output x (1A, 1B, 2A or 2B);
- Alarm Output x (1 or 2);
- Retransmit Output x (1 or 2);
- Digital Output x (1 to 8); and
- Communications
- 3. Go to the Operations Page and tune or set the PID sets.
- 4. Go to the Operations Page and set the alarm set points.
- 5. Go to the Profiles Page to program the profiles.

Customizing the Main Page

Up to 16 lines can be added to the Main Page to display status and information from the controller.

Go to the Setup Main Page menu on the Setup Page. The first screen will prompt you to choose one of the 16 lines to customize. "P1 Parameter" is the first line; "P16 Parameter" is the 16th. After choosing this line by pressing **○**, select a parameter to monitor. Your choices are:

- None
- Active Ch1 PID Set
 Active Ch2 PID Set

* When a digital input or output is active, its number will appear in the Main Page display; when it is inactive, its position will be underlined.

When a Wait for condition is still pending, its number will appear in the Main Page display; when it is no longer being awaited, it will be underlined. After the initial configuration of the controller, the most frequent changes will be to profiles, alarm set points and PID sets. The Setup Page is likely to be the least frequently accessed for changes. Some manufacturers may prefer to lock out this page to prevent user access.

Changing parameters may change other parameters. For example, changing the type of units (temperature, relative humidity, etc.) will affect settings that assume either Reset or Rate and Integral or Derivative. Changing from the Celsius to the Fahrenheit scale will affect every parameter with a numerical value in one or the other scale. In some cases, a change in one parameter will affect the defaults of others.

✓ NOTE:

Changes to some parameters will affect other parameters.

Sample Application: Setup for Environmental Testing

Before programming the profile to run the temperature and humidity tests in the environmental chamber, Andy had to configure the controller to suit the equipment and the test.

He went to the Setup Page, System Menu, and established the global system parameters, including the real-time clock, the date and the PID units. Then he continued through the list of inputs and outputs, configuring each and keeping notes about his settings on the User Setup Chart.

To enter, press the Right Key.

To exit, press the Left Key repeatedly.

Use a copy of the chart at the end of this chapter to record your settings.

Analog Input 1

For greatest accuracy in measuring the chamber temperature, a resistance temperature detection (RTD) sensor has been wired to analog input 1. Andy wanted to measure tenths of degrees Fahrenheit, with an alarm that would clear by itself if the temperature exceeded or fell below the active alarm set point band. Alarm set points are determined in the Operations Page.

> Sensor: RTD Type: DIN Decimal Point: 0.0 Set Point Low: 32.0°F

Set Point High: 450.0°F No Calibration Offset 0-second Filter Self-Clearing Error

Retransmit Output 1

To track the temperature of the equipment inside the chamber, Andy configured a retransmit output to match input 3. He scrolled down the list of inputs and outputs on the Setup Page and found Retransmit Output. He chose 50°F and 150°F, respectively, for the Scale Low and Scale High; the smaller the range, the higher the resolution on the chart.

Source: Input 3 Current: 4-20mA Scale Low: 50°F Scale High: 150°F Scale Offset: 0°F

Control Output x (1A, 1B, 2A, 2B)

Next, he scrolled back up to set the control outputs controlling heat and humidity. For the fastest possible switching rate, tighter control and longer heater life, he selected Burst Fire control for each of them, designating 1A and 1B as heat/cool outputs, and 2A and 2B as humidify/de-humidify outputs.

Digital Output 7

Digital output 7 was wired to an SSR (solid-state relay) that switched a solenoid valve controlling the flow of liquid nitrogen used for cooling.

Name: Default Function: Boost cool Boost Power Level: -90% Boost Delay: 20 seconds

Analog Input 2

The humidity sensor on analog input 2 was a process sensor using a 4 to 20 mA signal, so Andy set the high end of the scale (20mA) for 100% and the low (4mA) for 0% relative humidity (rh). Knowing that process sensor displays are sometimes jumpy, he put a 1-second filter on it to stabilize it.

Sensor: Process Type: Vaisala Units: % RH Scale Low: 0% Scale High: 100% Set Point Low: 10% Set Point High: 90% No Calibration Offset 1-second Filter Self-clearing Error

Alarms

He assigned an alarm output to indicate a temperature deviation on input 1, which would monitor chamber temperature, and gave it a name that would state the problem.

Name: TEMP DEV Type: Deviation Source: Input 1 Latch: Yes Silencing: Self-clear Alarm Hysteresis: 1, 1.0 Sides: Both Condition: Close on alarm Show: Yes

Digital Inputs

Then he set up the digital inputs for remote functions. Digital input 1 would be wired to a key-lock switch that requires the operator to have a key to operate the controller and chamber. Digital input 2 would be wired to a door switch to stop the profile if the chamber door opens.

Digital Input 1 Name: KEYLOCK Function: Panel lock Condition: Start on high

Digital Input 2 Name: Default Function: Pause Condition: High

Analog Input 3

A thermocouple (type J) sensor was adequate to measure the temperature of the equipment itself (analog input 3). The other settings remained the same as analog input 1.

Sensor: Thermocouple Type: J Decimal Point: Whole numbers only

Digital Output 6

For heating and cooling capacity and to accommodate the compressor, Andy assigned these functions to Digital outputs 6, 7 and 8.

Digital output 6, wired to a big auxiliary heater, was set up to kick in only when the main heater worked at greater than 90% power (boost power level) for more than 20 seconds (boost delay).

Name: BOOST HEAT Function: Boost heat Boost Power Level: 90% Boost Delay: 20 seconds

Digital Output 8

Andy set the compressor control parameter to have the compressor run only when cooling is needed.

% on Power: 0% % off Power: 9% Off Delay: 30 seconds On Delay: 60 seconds There was no computer connection, so Andy skipped Communications.

Then he left the Setup Page and went to the Factory Page where he put a password lock on the Setup Page, Profile Page and Factory Page.

Finally, he went to the Operations Page and set the active alarm band:

-20°F +20°F

Inputs/Outputs

Calibration Offset

Calibration offset allows a device to compensate for an inaccurate sensor, lead resistance or other factors that affect the input value. A positive offset increases the input value, and a negative offset decreases the input value.

You can view or change the offset value of inputs 1, 2 or 3 with the Calibration Offset parameter.

Location in software: Setup Page > Analog Input x (1 to 3).

Filter Time Constant

A time filter smooths an input signal by applying a first-order filter time constant to the signal. Either the displayed value or both the displayed and control values can be filtered. Filtering the displayed value makes it easier to monitor. Filtering the signal may improve the performance of PID control in a noisy or very dynamic system.

A positive value affects only the viewed values. A negative value affects both the viewed and control values.

Location in software: Setup Page > Analog Inputs x (1 to 3).

Figure 6.2b — Filtered and Unfiltered Input Signals.

Open Loop Detect

Open loop checks the integrity of the control loop, consisting of the controller output, power control, heater and sensor.

If the output power is at its maximum for a period of time equal to the reset time and the input has not changed at least \pm 5°F, the controller will switch to Manual Mode at 0% output power. The upper screen will display [oPLP`] and the lower screen will display "Open Loop."

To clear an open loop error, after correcting the problem that caused it, turn the controller off then back on. Location in software: Setup Page > System.

Set Point Low Limit and High Limit

The controller constrains the set point to a value between a low limit and a high limit. The high limit cannot be set higher than the sensor high limit or lower than the low limit. The low limit cannot be set lower than the sensor low limit or higher than the high limit.

You can view or change the input low limit (SP Low Limit) and the input high limit (SP High Limit) for analog inputs 1, 2 or 3.

Location in software: Setup Page > Analog Input x (1 to 3).

High Scale and Low Scale

When an analog input is selected as a process input, you must choose a value to represent the low and high ends of the current or voltage range. For example, if an analog input with a process sensor type 4 to 20mA is selected and the units are % Relative Humidity, then 0% could represent 4mA and 100% could represent 20mA. The set point will be limited to the range between scale low and scale high.

Location in software: Setup Page > Retransmit Output x (1 or 2).

Event

With an event input an operator can perform certain operations on a system by opening or closing a switch or applying a dc logic signal to the controller. This feature can add convenience, safety or security to a system.

In the Series F4, digital inputs 1 to 4 can be assigned as wait for events, as well as other process control features.

Location in software: Setup Page > Digital Input x (1 to 4) Condition.

Retransmit

Retransmit outputs 1 and 2 can retransmit an analog signal to serve as an input variable for another device. The signal may serve as a remote set point for another controller or as input for a chart recorder to document system performance over time.

Location in software: Setup Page.

Control Methods

On-Off Control

On-off control switches the output either full on or full off, depending on the input, set point and hysteresis values. The hysteresis value indicates the amount the process value must deviate from the set point to turn on the output. Increasing the value decreases the number of times the output will cycle. Decreasing hysteresis improves controllability. With hysteresis set to 0 the process value would stay closer to the set point, but the output would switch on and off more frequently, causing "chattering."

Set the proportional band to 0 to set the controller to on-off control mode.

Proportional Band x (A or B) location in software: Operations Page > Edit PID > PID Channel x (1 or 2) > PID Set x (1 to 5) or (6 or 10).

Hysteresis x (A or B) location in software: Operations Page > Edit PID > PID Set Channel x (1 or 2) > PID Set x (1 to 5) or (6 or 10).

✓ NOTE:

 $Fail \ power \ does \ not \ function \ in \ on \ / \ off \ control \ mode.$

Proportional Control

Some processes need to maintain a temperature or process value closer to the set point than on-off control can provide. Proportional control provides closer control by adjusting the output when the temperature or process value is within a proportional band. When the value is in the band, the controller adjusts the output based on how close the process value is to the set point; the closer to set point the lower the output. This is similar to backing off on the gas pedal of a car as you approach a stop sign. It keeps the temperature or process value from swinging as widely as it would with simple on-off control. However, when a system settles down, the temperature or process value tends to "droop" short of the set point.

With proportional control the output power level equals (set point minus process value) divided by propband.

Location in software: Operations Page > Edit PID > PID Set Channel x (1 or 2) > PID Set x (1 to 5) or (6 to 10).

Figure 6.4a — On-off Control for Heating and Cooling.

Proportional plus Integral (PI) Control

The droop caused by proportional control (reset) can be corrected by adding integral control. When the system settles down the integral value is tuned to bring the temperature or process value closer to the set point. Integral determines the speed of the correction, but this may increase the overshoot at startup or when the set point is changed. Too much integral action will make the system unstable. Integral is cleared when the process value is outside of the proportional band.

Integral (if units are set to SI) is measured in minutes per repeat. A low integral value causes a fast integrating action.

Reset rate (if units are set to U.S.) is measured in repeats per minute. A high reset value causes a fast integrating action.

Location in software: Operations Page > Edit PID > PID Set Channel x (1 or 2) > PID Set x (1 to 5) or (6 to 10).

Proportional Integral Derivative (PID) Control

Use derivative rate control to minimize overshoot in a PI-controlled system. Derivative adjusts the output based on the rate of change in the temperature or process value. Too much derivative will make the system sluggish.

Location in software: Operations Page > Edit PID > PID Set Channel x (1 or 2) > PID Set x (1 to 5) or (6 to 10).

Figure 6.5a — Proportional Plus Integral Control.

Dead Band

In a multiple PID application the dead bands above and below the set point can save an application's energy and wear by maintaining process temperature within acceptable ranges. Shifting the effective cooling set point and heating set point keeps the two systems from fighting each other.

Proportional action ceases when the process value is within the dead band. Integral action continues to bring the process temperature to the set point. When the dead band value is zero, the heating element activates when the temperature drops below the set point, and the cooling element switches on when the temperature exceeds the set point.

Location in software: Operations Page > Edit PID >PID Set Channel x (1 or 2) > PID Set x (1 to 5) or 6 to 10).

Multiple PID Sets

The Series F4 has five PID sets available for each channel, sets 1 to 5 for Channel 1 and sets 6 to 10 for Channel 2, allowing optimal performance under different conditions, loads and temperatures. In the Static Set Point mode, PID Set 1 is used for Channel 1 and PID Set 6 is used for Channel 2 control. When programming a profile, you can assign different sets to each Ramp step and Soak step.

A PID set includes proportional, integral and derivative settings for outputs A and B. It also includes dead band, as long as the proportional band is not set to 0.

Location in software: Operations Page > Edit PID > PID Set Channel x (1 or 2) > PID Set x (1 to 5) or (6 to 10).

Burst Fire

Burst firing provides even output power with the lowest level of noise generation (RFI). Burst fire is the preferred method for controlling a resistive load, providing a very short time base for longer heater life.

The controller determines when the ac sine wave will cross the 0-volts point, then switches the load on or off only at this point, minimizing RFI.

Location in software: Setup Page > Control Output x (1 to 3).

Channel 1 (Heat/Cool) Output 1A Heat Output 1B Cool PID Sets 1 to 5 PropBand A Integral A Derivative A Dead Band A PropBand B Integral B Derivative B Dead Band B Channel 2 (Relative Humidity) Output 2A Humidify Output 2B Dehumidify PID Sets 6 to 10 PropBand A Integral A Derivative A Dead Band A PropBand B Integral B Derivative B Dead Band B

Figure 6.6 — Burst Fire.

Other Features

Autotuning

The autotuning feature allows the controller to measure the system response to determine effective settings for PID control. When autotuning is initiated the controller reverts to on-off control. The temperature must cross the auto-tune set point four times to complete the autotuning process. Once complete, the controller controls at the normal set point, using the new parameters. The F4 stores the value in the PID set specified.

Location in software: Operations Page > Autotune PID > Channel 1 Autotune > PID Set x (1 to 5) or Channel 2 Autotune > PID Set x (6 to 10).

$\underline{\mathbb{A}}$

CAUTION: Choose an auto-tune set point value that will protect your product from possible damage from overshoot or undershoot during the autotuning oscillations. If the product is sensitive, carefully select the auto-tune set point to prevent product damage.

Power-Out Time/Power-Out Action

The Power-Out Time and Power-Out Action parameters direct the F4's response to the interruption of electrical power while running a profile. The F4's battery-powered real-time clock tracks the amount of time the power is out. When power is restored, the controller compares this amount of time to the Power-Out Time setting and takes whatever action is selected in the Power-Out Action setting.

First, determine how long the power can be interrupted without adversely affecting results. Set the Power-Out Time to this time. If power is returned in less time than this setting, the profile will resume running. (The profile run time stops while the power is off.) If power is returned after a time longer than this setting, the F4 will take action based on the user-configured Power-Out Action parameter: **Continue** (resume the profile at the point that power was interrupted); **Hold** (hold the profile at the point that power was interrupted); **Terminate** (stop the profile using the End step conditions); **Reset** (restart the profile from Step 1); **Idle** (stop the profile and transfer to an idle setpoint).

Location in software: Setup Page > System > Power-Out Time > Power-Out Action.

✓ NOTE: For manual tuning, see the Operations Chapter.

✔ NOTE:

The Power Out Action occurs only if a profile was running when the power went out. If a profile was on hold, it will return to its Hold status when the power returns.
Alarms

Alarms are activated when the process value or temperature leaves a defined range. A user can configure how and when an alarm is triggered, what action it takes and whether it turns off automatically when the alarm condition is over.

Configure alarm outputs in the Setup Page before setting alarm set points.

Alarm Set Points

The alarm high set point defines the process value or temperature that will trigger a high side alarm. It must be higher than the alarm low set point and lower than the high limit of the sensor range.

The alarm low set point defines the temperature that will trigger a low side alarm. It must be lower than the alarm high set point and higher than the low limit of the sensor range.

Location in software: Operations Page > Alarm Set Point > Alarm x (1 or 2).

Alarm Hysteresis

An alarm state is triggered when the process value reaches the alarm high or alarm low set point. Alarm hysteresis defines how far the process must return into the normal operating range before the alarm can be cleared.

Alarm hysteresis is a zone inside each alarm set point. This zone is defined by adding the hysteresis value to the alarm low set point or subtracting the hysteresis value from the alarm high set point.

Location in software: Setup Page > Alarm Output x (1 or 2).

High Side Alarm Range Alarm High Set Point Alarm Hysteresis Normal Operating Range Alarm Hysteresis Low Side Alarm Range Time Figure 6.8 — Alarm Settings.

Process or Deviation Alarms

A process alarm uses one or two absolute set points to define an alarm condition. A deviation alarm uses one or two set points that are defined relative to the control set point. High and low alarm set points are calculated by adding and/or subtracting offset values from the control set point. If the set point changes, the window defined by the alarm set points automatically changes with it.

In the Series F4 you must configure each alarm output as either a process or deviation alarm.

Location in software: Setup Page > Alarm Output x (1 or 2).

Alarm Latching

A latched alarm will remain active after the alarm condition has passed. It can only be deactivated by the user. An alarm that is not latched (self-clearing) will deactivate automatically when the alarm condition has passed.

Location in software: Setup Page > Alarm x (1 or 2).

Alarm Silencing

Alarm silencing has two uses:

- 1. It is often used to allow a system to warm up after it has been started up. With alarm silencing on, an alarm is not triggered when the process temperature is initially lower than the alarm low set point. The process temperature has to enter the normal operating range beyond the hysteresis zone to activate the alarm function.
- 2. Alarm silencing also allows the operator to disable the alarm output while the controller is in an alarm state. The process temperature has to enter the normal operating range beyond the hysteresis zone to activate the alarm output function.

If the Series F4 has an output that is functioning as a deviation alarm, the alarm is silenced when the set point is changed, until the process value reenters the normal operating range.

Location in software: Setup Page > Alarm x (1 or 2).

Alarm Sides

Alarms can be configured to trigger when the process exceeds the High Alarm Set Point, the Low Alarm Set Point or both.

Location in software: Setup Page > Alarm x (1 or 2).

(Alarm set points are established in the Operations Page.)

Advanced Features

Boost Heat and Boost Cool

The boost heat feature uses a digital output to turn on an additional heater to speed up the heating. As the process temperature approaches the set point, the boost heat output switches off so that the process temperature doesn't overshoot the set point.

Boost cool uses a digital output to speed up the cooling process, typically by activating a solenoid valve that releases liquid nitrogen.

For either boost heat or boost cool, set Boost % Power to define the power level that must be exceeded before the boost output is activated. Use a positive value for heating, a negative value for cooling.

To prevent the output from cycling and to extend hardware life, define Boost Time Delay in seconds to set the minimum period of time that the output will remain off after an on cycle.

The Series F4 uses digital output 6 for boost heat and digital output 7 for boost cool. Hysteresis for boost heat and cool is fixed at 5%.

Location in software: Setup > Digital Output x (6 or 7).

Figure 6.10a — Boost Heat and Boost Cool.

Compressor Control

The compressor control can save wear on a compressor and prevent it from locking up from short cycling. A bypass valve operated by a control output regulates how the process is cooled, while a digital output switches the compressor on and off.

The Series F4 uses digital output 8 for compressor control. Compressor On % Power sets the power level that will switch the compressor on. Compressor Off % Power sets the power level that will switch the compressor off.

The compressor will not turn on until the output power exceeds the Compressor On % Power for a time longer than the Compressor On Delay. The compressor will not turn off until the output power exceeds the Compressor Off % Power for a time longer than the Compressor Off Delay.

Location in software: Setup Page > Digital Output 8.

Cascade

Cascade control is a control strategy in which one control loop provides the set point for another loop. It allows the process or part temperature to be reached quickly while minimizing overshoot. Cascade is used to optimize the performance of thermal systems with long lag times.

This graph illustrates a thermal system with a long lag time. Curve A represents a single-loop control system with PID parameters that allow a maximum heat-up rate. Too much energy is introduced and the set point is overshot. In most systems with long lag time, the process value may never settle out to an acceptable error. Curve C represents a single-control system tuned to minimize overshoot. This results in unacceptable heat-up rates, taking hours to reach the final value. Curve B shows a cascade system that limits the energy introduced into the system, allowing an optimal heat-up rate with minimal overshoot.

Cascade control uses two control loops (outer and inner) to control the process. The outer loop (analog input 3) monitors the process or part temperature, which is then compared to the set point. The result of the comparison, the error signal, is acted on by the settings in a Cascade Outer Loop PID set (1 to 5), which then generates a power level for the outer loop. The set point for the inner loop is determined by the outer-loop power level and the Cascade Low Range/Deviation and the Cascade High Range/Deviation settings for analog input 3.

The inner loop (analog input 1) monitors the energy source (heating and cooling), which is compared to the inner loop set point generated by the outer loop. The result of the comparison, the error signal, is acted on by the settings in a Cascade Inner Loop PID set (1 to 5), which generates an output power level between -100% to +100%. If the power level is positive the heat will be on; if the power level is negative the cool will come on.

In Series F4 controllers, cascade control is available on channel 1. Analog input 3 is used to measure the outer-loop process while analog input 1, the inner loop, is used to measure the energy source. Power from the energy sources are supplied by outputs 1A and 1B.

To set up and tune a system for cascade control, see the Operations Chapter.

Location in software: Setup Page and Operations Page.

Figure 6.11a — Control Lag Times.

✓ NOTE: Cascade Low Range and Cascade High Range Set Points for Input 1 (as shown above) are setup under Analog Input 3. Refer to Setup Chapter.

Figure 6.11 — Cascade Example

Notes

Chapter Seven: Communications

Exception Responses	.7.2
Modbus Registers (Alphabetical Order)	.7.2
Profiling Registers	.7.10
Modbus Registers (Numerical Order)	.7.13
Communications Page Parameter Table	.7.16
Profiling Flow Charts	.7.17

Overview

The Series F4 uses Modbus as its communications protocol. Modbus is a standard protocol developed by A.E.G. Schneider. Modbus RTU enables a computer or PLC to read and write directly to registers containing the controller's parameters. With it you can read all of the controller's parameters with a few read commands.

If you already have a software application that uses Modbus, the Modbus Registers Table in this chapter will provide the register number and values (sometimes called enumerated types) for each parameter. Dependencies between parameters do exist. For best results, program the parameters in the order in which they appear in the Software Map (inside back cover).

To program a profile using Modbus, refer to the Profiling Flow Charts in this chapter.

For basic information about writing an application using Modbus protocol, you may want to download the electronic *Watlow Controls Data Communications Guide* from the Watlow web site:

http://www.watlow.com/prodtechinfo

Search on data communications reference.

Exception Responses

When a controller cannot process a command it returns an exception response and sets the high bit (0x80) of the command.

0x01 illegal command

0x02 illegal data address

0x03 illegal data value

Packet returned by controller:	nn	nn	nn	nn nn	
	Δ	Δ	Δ	$\Delta \Delta$	
controller address (one byte)					
command + 0x80					
exception code (0x01 or 0x02 or 0x03	3) ———				
CRC low byte					
CRC high byte					

✔ NOTE:

For ranges, conditions and other information, look up parameter names in the Index, which will direct you to earlier chapters in this book.

Series F4 Modbus Registers

Parameters Sorted Alphabetically

Register numbers listed are relative values. To convert to absolute values, add 40001. Registers for profiling parameters are in a separate section at the end of this list, followed by a list of all Modbus registers in numerical order. For more information about parameters, see the Index.

affect the controller's operation, see the Features Chapter.

F4 Modbus Applications: Profile Programming Procedures

F4 Modbus Applications: Profile Overview

A maximum of 40 files may be created, with a total of 256 steps. Each time a new file is created, the file is placed after the previously created file. As files are deleted, newly created files are placed into these locations. Modbus Register 4000 returns the file number of the newly created file.

*Profiles without custom-written names are referred to by their numbers (Profile 1, Profile 2, etc.),

F4 Modbus Applications: Creating a Profile

*Profiles without custom-written names are referred to by their numbers (Profile 1, Profile 2, etc.),

F4 Modbus Applications: Autostart Step

Autostart pauses a profile until the specified date or day, and time (of a 24-hour-clock).

F4 Modbus Applications: Ramp Time, Ramp Rate, Soak Steps (page 1 of 3)

Digital inputs must be configured as Events before profiling: "Digital Input 1 to 4 Function = Wait for Event" and "Digital Input 1 to 4 Condition = Low or High." Modbus Registers 1060 through 1067. See Setup Page Map.

F4 Modbus Applications: Ramp Time, Ramp Rate, Soak Steps (page 2 of 3)

Analog inputs and digital outputs must be configured before programming a profile. See Setup Page Map.

F4 Modbus Applications: Ramp Time, Ramp Rate, Soak Steps (page 3 of 3)

Watlow Series F4S/D

F4 Modbus Applications: Editing, Deleting, Starting a Profile

F4 Modbus Applications: Naming a Profile

Profiles without custom-written names are referred to by their numbers (Profile 1, Profile 2, etc.). Follow this procedure to customize the profile name, using ASCII-equivalent decimal codes (in the column labeled "Dec" in the chart below).

Renaming a Profile - F4 via Modbus Communication

F4 Modbus Applications: Monitor Current Step

Chapter Eight: Security and Locks

Overview

The Series F4 allows users to set separate security levels for the Static Set Point prompt on the Main Page, for all menus on the Operations Page, as well as for the Profiles Page, Setup Page and Factory Page. Four levels of security are available:

- **Full Access** (operators can enter and change settings);
- **Read Only** (operators can read but not change settings);
- **Password** (operators can enter and change settings after entering a password); and
- **Hidden** (operators cannot see the menu or page it is not displayed). Set Point settings cannot be Hidden.

Full Access is the default for all menus. Unless you change the level of access, operators will be able to read and change every setting in every menu in the Series F4 software.

Set Lock Levels

To set levels of security, go to "Set Lockout," on the Factory Page. Press the Right Key **O**. This menu lists the menus for which access can be limited:

- Set Point on Main Page
- Operations Page Autotune PID
- Operations Page Edit PID
- Operations Page Alarm Set Point
- Profiles Page
- Setup Page
- Factory Page

After choosing the item to lock out, press • and choose the level of access: Full, Read Only, Password or Hidden. If you choose Password, you must set the password — see below.

✔ NOTE:

Full Access is the default for all menus. Unless you change the level of access, operators will be able to read and change every setting in every menu in the Series F4 software.

✔ NOTE:

For more information about how parameter settings affect the controller's operation, see the Features Chapter. Main>Factory_____ >Set Lockout Diagnostic Test ...Factory>Set Lock____ Set Point >Oper. Autotune PID ■ Oper. Edit PID ▼ ...Lock>Autotune PID___ Full Access Read Only >Password

Enter a Password

If you try to set password security before any password has been established, a pop-up message will give you the opportunity to enter one. Use the **O O O** keys to enter a four-character password, which can consist of letters, numbers or both. After entering and confirming the password, re-enter the chosen menu or page and select Password Security. Record your password and keep it secure.

Use a Password

To enter a password-protected area, users must enter the password. If an incorrect password is entered, a pop-up message will tell you it is invalid and you may try again. When the password is correct, choose again to enter the menu or page of your choice.

Change a Password

The Change Password parameter is near the end of the list under Set Lockout on the Factory Page. To change a password, you must first enter the old password for confirmation.

0 Must have password before choosing the password lock! Must reset lock after setting the password ■■■Press any key!■■■ Enter New Password: ▲▼ Adjusts Char 4 🕨 Save Changes Confirm Password: ▲▼ Adjusts Char Save Changes

Invalid, Re-Enter:____

Chapter Nine: Calibration

Thermocouple Input Procedure	
RTD Input Procedure	
Voltage Process Input Procedure	
Current Process Input Procedure	
Process Output Procedure	
Retransmit Output Procedure	
Calibration Menu Map9.6	
Factory Page Parameter Table	

Overview

The Calibration Menu on the Factory Page allows calibration of inputs and outputs. Calibration procedures should be done only by qualified technical personnel with access to the equipment listed in each section.

Before beginning calibration procedures, warm up the controller for at least 20 minutes.

Restore Factory Values

Each controller is calibrated before leaving the factory. If at any time you want to restore the factory calibration values, use the last parameters in the menu: Restore In x (1 to 3) Cal. Press \bigcirc . No special equipment is necessary.

✔ NOTE:

To see how all the pages, menus and parameters are grouped, refer to the inside back cover of this manual.

✔ NOTE:

For more information about how parameter settings affect the controller's operation, see the Features Chapter.
Calibrating the Series F4

Thermocouple Input Procedure

Equipment

- Type J reference compensator with reference junction at 32°F (0°C), or type J thermocouple calibrator to 32°F (0°C).
- Precision millivolt source, 0 to 50mV minimum range, 0.002mV resolution.

Input x (1 to 3) Setup and Calibration

- 1. Connect the correct power supply to terminals 1, 2 and 3 (see the Wiring Chapter and the Appendix).
- 2. Connect the millivolt source to Input 1 terminals 62 (-) and 61 (+), Input 2 terminals 58 (-) and 57 (+), or Input 3 terminals 56 (-) and 55 (+), with copper wire.
- 3. Enter 50.000mV from the millivolt source. Allow at least 10 seconds to stabilize. Press the Right Key O once at the Calibrate Input x (1 to 3) prompt (Factory Page). At the 50.00mV prompt press O once and to store 50.00mV press the Up Key O once.
- Enter 0.000mV from the millivolt source. Allow at least 10 seconds to stabilize. At the 0.00mV prompt press O once and to store 0.00mV press O once.
- 5. Disconnect the millivolt source and connect the reference compensator or thermocouple calibrator to Input 1 terminals 62 (-) and 61 (+) or Input 2 or 3 terminals 58 (-) and 57 (+). With type J thermocouple wire, if using a compensator, turn it on and short the input wires. When using a type J calibrator, set it to simulate 32°F (0°C). Allow 10 seconds for the controller to stabilize. Press once at the Calibrate Input x (1 or 2) prompt (Factory Page). At the 32°F Type J prompt press once and to store type J thermocouple calibration press once.
- 6. Rewire for operation and verify calibration.

RTD Input Procedure

Equipment

• $1k\Omega$ decade box with 0.01Ω resolution.

Input x (1 to 3) Setup and Calibration

- 1. Connect the correct power supply to terminals 1, 2 and 3 (see the Wiring Chapter and the Appendix).
- Short Input 1 terminals 60, 61 and 62; Input 2 terminals 54, 57 and 58; or Input 3 terminals 52, 55 and 56 together with less than 0.1Ω. Press the Right Key O once at the Calibrate Input x (1 to 3) prompt. At the Ground prompt press O once and to store ground input press the Up Key O once.
- 3. Short Input 1 terminals 60 and 61; Input 2 terminals 54 and 57; or Input 3 terminals 52 and 55 together with less than 0.5Ω. Press once at the Calibrate Input x (1 to 3) prompt. At the Lead prompt press once and to store lead resistance press once.
- 4. Connect the decade box to Input 1 terminals 60 (S2), 61 (S1) and 62 (S3); Input 2 terminals 54 (S2), 57 (S1) and 58 (S3); or Input 3 terminals 52 (S2), 55 (S1) and 56 (S3), with 20- to 24-gauge wire.
- 5. For 100Ω RTD, enter 15.00Ω . For 500Ω or $1k\Omega$ RTD, enter 240.00Ω . Allow at least 10 seconds to stabilize. Press \bigcirc once at the Calibrate Input x (1 to 3) prompt (Factory Page). At the 15.00Ω or $240.00\Omega^*$ prompt press \bigcirc once and to store the 15.00Ω or 240.00Ω input press \bigcirc once.
- 6. For 100Ω RTD, enter 380.00Ω. For 500Ω or 1kΩ RTD, enter 6080.00Ω. Allow at least 10 seconds to stabilize. Press O once at the Calibrate Input x (1 to 3) prompt. At the 380.0Ω or 6080.00Ω* prompt press O once and to store the 380.00Ω or 6080.00Ω input press O once.
- 7. Rewire for operation and verify calibration.

✓ NOTE:

You need the equipment listed and technical skills. Controllers come calibrated from the factory. Recalibrate only for other agency requirements or if temperatures aren't accurate as verified by another calibrated instrument. *The tenth character of your model number determines what prompts appear and what input resistance values to use for the RTD calibration.

 $F4______(1 \text{ to } 4)RG: 15.00 \text{ and } 380.00\Omega$ $F4______(5 \text{ to } 8)RG: 240.00 \text{ and } 6080.00\Omega$

Voltage Process Input Procedure

Equipment

• Precision voltage source, 0 to 10V minimum range, with 0.001V resolution.

Input x (1 to 3) Setup and Calibration

 Connect the correct power supply to terminals 1, 2 and 3 (see the Wiring Chapter and the Appendix).

Input 1

- 2. Connect the voltage source to terminals 59 (+) and 62 (-) of the controller.
- Enter 0.000V from the voltage source to the controller. Allow at least 10 seconds to stabilize. Press the Right Key once at the Calibrate Input 1 prompt. At the 0.000V prompt press once and to store the 0.000V input press the Up Key once.
- 4. Enter 10.000V from the voltage source to the controller. Allow at least 10 seconds to stabilize. Press O once at the Calibrate Input 1 prompt. At the 10.000V prompt press O once and to store the 10.000V input press O once.

Input 2

- 5. Connect the voltage source to terminals 53 (+) and 58 (-) of the controller.
- 6. Enter 0.000V from the voltage source to the controller. Allow at least 10 seconds to stabilize. Press O once at the Calibrate Input 2 prompt. At the 0.000V prompt press O once and to store the 0.000V input press O once.
- 7. Enter 10.000V from the voltage source to the controller. Allow at least 10 seconds to stabilize. Press O once at the Calibrate Input 2 prompt (Factory Page). At the 10.000V prompt press O once and to store the 10.000V input press O once.

Input 3

- 8. Connect the voltage source to terminals 51 (+) and 56 (-) of the controller.
- 9. Enter 0.000V from the voltage source to the controller. Allow at least 10 seconds to stabilize. Press O once at the Calibrate Input 3 prompt. At the 0.000V prompt press O once and to store the 0.000V input press O once.
- 10. Enter 10.000V from the voltage source to the controller. Allow at least 10 seconds to stabilize.

Press O once at the Calibrate Input 3 prompt (Factory Page). At the 10.000V prompt press O once and to store the 10.000V input press O once.

11. Rewire for operation and verify calibration.

Current Process Input Procedure

Equipment

• Precision current source, 0 to 20mA range, with 0.01mA resolution.

Input x (1 to 3) Setup and Calibration

1. Connect the correct power supply to terminals 1, 2 and 3 (see the Wiring Chapter and the Appendix).

Input 1

- 2. Connect the current source to terminals 60 (+) and 62 (-).
- 3. Enter 4.000mA from the current source to the controller. Allow at least 10 seconds to stabilize. Press the Right Key once at the Calibrate Input 1 prompt. At the 4.000mA prompt press once and to store 4.000mA press the Up Key once.
- 4. Enter 20.000mA from the current source to the controller. Allow at least 10 seconds to stabilize. Press once at the Calibrate Input 1 prompt. At the 20.000mA prompt press once and to store 20.000mA press once.

Input 2

- 5. Connect the current source to terminals 54 (+) and 58 (-).
- 6. Enter 4.00mA from the current source to the controller. Allow at least 10 seconds to stabilize. Press once at the Calibrate Input 2 prompt. At the 4.000mA prompt press once and to store 4.000mA press once.
- 7. Enter 20.00mA from the current source to the controller. Allow at least 10 seconds to stabilize. Press O once at the Calibrate Input 2 prompt. At the 20.000mA prompt press O once and to store 20.000mA press O once.

Input 3

- 8. Connect the voltage source to terminals 52 (+) and 56 (-) of the controller.
- 9. Enter 4.000mA from the current source to the controller. Allow at least 10 seconds to stabilize.

Press O once at the Calibrate Input 3 prompt. At the 4.000mA prompt press O once and to store the 4.000mA input press O once.

- 10. Enter 20.000mA from the current source to the controller. Allow at least 10 seconds to stabilize. Press O once at the Calibrate Input 3 prompt (Factory Page). At the 20.000mA prompt press O once and to store the 20.000mA input press O once.
- 11. Rewire for operation and verify calibration.

Process Output Procedure

Equipment

• Precision volt/ammeter with 3.5-digit resolution.

Output 1A Setup and Calibration

1. Connect the correct power supply to terminals 1, 2 and 3 (see the Wiring Chapter and the Appendix).

Milliamperes

- 2. Connect the volt/ammeter to terminals 42 (+) and 43 (-).
- Press the Right Key at the Calibrate Output 1A prompt. At the 4.000mA prompt press once. Use the Up Key or the Down Key to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 4.000mA. Press to store the value.
- 4. Press the Right Key O at the Calibrate Output 1A prompt. At the 20.000mA prompt press
 O once. Use the Up Key O or the Down Key
 O to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 20.000mA. Press O to store the value.

Volts

- 5. Connect the volt/ammeter to terminals 44 (+) and 43 (-).
- 6. Press the Right Key at the Calibrate Output 1A prompt. At the 1.000V prompt press once. Use the Up Key or the Down Key to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 1.000V. Press to store the value.

- Press the Right Key O at the Calibrate Output 1A prompt. At the 10.000V prompt press O once. Use the Up Key O or the Down Key O to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 10.000V. Press O to store the value.
- 8. Rewire for operation and verify calibration.

Output 1B Setup and Calibration

1. Connect the correct power supply to terminals 1, 2 and 3 (see the Wiring Chapter and the Appendix).

Milliamperes

- 2. Connect the volt/ammeter to terminals 39 (+) and 40 (-).
- 3. Press the Right Key at the Calibrate Output 1B prompt. At the 4.000mA prompt press once. Use the Up Key or the Down Key to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 4.000mA. Press to store the value.
- 4. Press the Right Key O at the Calibrate Output 1B prompt. At the 20.000mA prompt press O once. Use the Up Key O or the Down Key O to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 20.000mA. Press O to store the value.

Volts

- 5. Connect the volt/ammeter to terminals 41 (+) and 40 (-).
- 6. Press the Right Key at the Calibrate Output 1B prompt. At the 1.000V prompt press once. Use the Up Key or the Down Key to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 1.000V. Press to store the value.
- 7. Press the Right Key O at the Calibrate Output 1B prompt. At the 10.000V prompt press O once. Use the Up Key O or the Down Key O to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 10.000V. Press O to store the value.
- 8. Rewire for operation and verify calibration.

Output 2A Setup and Calibration

1. Connect the correct power supply to terminals 1, 2 and 3 (see the Wiring Chapter and the Appendix).

Milliamperes

- 2. Connect the volt/ammeter to terminals 36 (+) and 37 (-).
- 3. Press the Right Key ♥ at the Calibrate Output 2A prompt. At the 4.000mA prompt press ♥ once. Use the Up Key ♥ or the Down Key ♥ to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 4.000mA. Press ♥ to store the value.
- 4. Press the Right Key O at the Calibrate Output 2A prompt. At the 20.000mA prompt press
 O once. Use the Up Key O or the Down Key
 O to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 20.000mA. Press O to store the value.

Volts

- 5. Connect the volt/ammeter to terminals 38 (+) and 37 (-).
- 6. Press the Right Key at the Calibrate Output 2A prompt. At the 1.000V prompt press once. Use the Up Key or the Down Key to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 1.000V. Press to store the value.
- 7. Press the Right Key O at the Calibrate Output 2A prompt. At the 10.000V prompt press O once. Use the Up Key O or the Down Key O to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 10.000V. Press O to store the value.
- 8. Rewire for operation and verify calibration.

Output 2B Setup and Calibration

 Connect the correct power supply to terminals 1, 2 and 3 (see the Wiring Chapter and the Appendix).

Milliamperes

- 2. Connect the volt/ammeter to terminals 33 (+) and 34 (-).
- 3. Press the Right Key 🔿 at the Calibrate Out-

put 2B prompt. At the 4.000mA prompt press \bigcirc once. Use the Up Key \bigcirc or the Down Key \bigcirc to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 4.000mA. Press \bigcirc to store the value.

4. Press the Right Key O at the Calibrate Output 2B prompt. At the 20.000mA prompt press O once. Use the Up Key O or the Down Key O to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 20.000mA. Press O to store the value.

Volts

- 5. Connect the volt/ammeter to terminals 35 (+) and 34 (-).
- 6. Press the Right Key at the Calibrate Output 2B prompt. At the 1.000V prompt press once. Use the Up Key or the Down Key to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 1.000V. Press to store the value.
- 7. Press the Right Key ♥ at the Calibrate Output 2B prompt. At the 10.000V prompt press ♥ once. Use the Up Key ♥ or the Down Key ♥ to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 10.000V. Press ♥ to store the value.
- 8. Rewire for operation and verify calibration.

Retransmit Output Procedure

Equipment

• Precision volt/ammeter with 3.5-digit resolution.

Retransmit 1 Setup and Calibration

1. Connect the correct power supply to terminals 1, 2 and 3 (see the Wiring Chapter and the Appendix).

Milliamperes

- 2. Connect the volt/ammeter to terminals 50 (+) and 49 (-).
- 3. Press the Right Key O at the Calibrate Rexmit 1 prompt. At the 4.000mA prompt press
 O once. Use the Up Key O or the Down Key

◆ to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 4.000mA. Press ◆ to store the value.

4. Press the Right Key O at the Calibrate Rexmit 1 prompt. At the 20.000mA prompt press O once. Use the Up Key O or the Down Key O to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 20.000mA. Press O to store the value.

Volts

- 5. Connect the volt/ammeter to terminals 48 (+) and 49 (-).
- 6. Press the Right Key O at the Calibrate Rexmit 1 prompt. At the 1.000V prompt press
 O once. Use the Up Key O or the Down Key
 O to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 1.000V. Press O to store the value.
- 7. Press the Right Key O at the Calibrate Rexmit 1 prompt. At the 10.000V prompt press
 O once. Use the Up Key O or the Down Key
 O to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 10.000V. Press O to store the value.
- 8. Rewire for operation and verify calibration.

Retransmit 2 Setup and Calibration

1. Connect the correct power supply to terminals

1, 2 and 3 (see the Wiring Chapter and the Appendix).

Milliamperes

- 2. Connect the volt/ammeter to terminals 47 (+) and 46 (-).
- 3. Press the Right Key O at the Calibrate Rexmit 2 prompt. At the 4.000mA prompt press
 O once. Use the Up Key O or the Down Key
 O to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 4.000mA. Press O to store the value.
- 4. Press the Right Key at the Calibrate Rexmit 2 prompt. At the 20.000mA prompt press once. Use the Up Key or the Down Key to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 20.000mA. Press to store the value.

Volts

- 5. Connect the volt/ammeter to terminals 45 (+) and 46 (-).
- 6. Press the Right Key O at the Calibrate Rexmit 2 prompt. At the 1.000V prompt press
 O once. Use the Up Key O or the Down Key
 O to adjust the display to the reading on the volt/ammeter. The controller should stabilize within one second. Repeat until the volt/ammeter reads 1.000V. Press O to store the value.
- 7. Press the Right Key O at the Calibrate Rexmit 2 prompt. At the 10.000V prompt press
 O once. Use the Up Key O or the Down Key

10 Chapter Ten: **Diagnostics**

Overview

Diagnostic Menu parameters (on the Factory Page) provide information about the controller unit that is useful in troubleshooting. For example, the Model parameter will identify the 12-digit Series F4 part number. The Out1A parameter will identify what type of output has been selected for Output 1A.

Diagnostic Menu Map

Mode1 Mfg Date Serial # Software # Revision In1 In2 In3 Out1A Out1B Out2A Out2B Retrans1 Retrans2 In1 AtoD In2 AtoD In3 AtoD CJC1 AtoD CJC2 AtoD CJC1 Temp CJC2 Temp Line Freq

✔ NOTE:

To see how all the pages, menus and parameters are grouped, refer to the inside back cover of this manual. Select the parameter by pressing the Right Key **O**. The information will appear on the Lower Display.

Some of the parameters in the Diagnostic Menu provide information for factory use only.

To reset all parameters to their original factory values, use the Full Defaults parameter under the Test Menu.

Test Menu Map

Test Outputs Display Test Full Defaults

✔ NOTE:

For more information about how parameter settings affect the controller's operation, see the Features Chapter.

11 Chapter Eleven: Installation

Dimensions

Figure 11.1a — Front View Dimensions and Gasket Gap Dimension.

Figure 11.1b — Side and Top View and Dimensions.

Panel Dimensions

Figure 11.2a — Multiple Panel Cutout Dimensions.

Installing the Series F4 Controller

Installing and mounting requires access to the back of the panel.

Tools required: one #2 Phillips screwdriver.

- 1. Make the panel cutout using the mounting template dimensions in this chapter.
- 2. Insert the controller into the panel cutout. Check that the rubber gasket lies in its slot at the back of the bezel. Slide the retention collar over the case, with open holes facing the back of the case.
- 3. Align the mounting bracket with the screws tips pointed toward the panel. Squeezing the bowed sides of the bracket, push it gently but firmly over the case until the hooks snap into the slots at the front of the case.

Figure 11.2b — Gasket Seated on the Bezel.

4. If the installation does not require a NEMA 4X seal, tighten the four screws with the Phillips screwdriver just enough to eliminate the spacing between the rubber gasket and the mounting panel.

For a NEMA 4X seal, tighten the four screws until the gap between the bezel and panel surface is .020 in. maximum. (See figure 11.1b). Make sure that you cannot move the controller back and forth in the cutout. If you can, you do not have a proper seal. **Do not over tighten.** Over tightening could damage the the mounting bracket.

Removing the Series F4 Controller

The controller can be removed most easily by disengaging the mounting bracket hooks and pushing the controller forward through the panel. Be ready to support it as it slides forward through the panel.

Tools required: one #2 Phillips screwdriver, one flathead screwdriver and some means of supporting the controller as it slides out the front of the panel.

- 1. Remove all the wiring connectors from the back of the controller. Using the Phillips screwdriver, unscrew the four screws on the mounting bracket (two on top, two on bottom) until the tips are completely retracted into the shafts.
- 2. Slide the tip of a flat screwdriver between the case and the center top side of the mounting bracket. Rotate the screwdriver 90 degrees, stretching the bracket away from the case so the hooks on the bracket disengage from the slots on the case. Hold the bracket and press the controller forward slightly to prevent the disengaged hooks from snapping back into the slots.
- 3. Repeat this operation to disengage the hooks on the bottom side of the mounting bracket.
- 4. Press with one or two fingers on the lower half of the back of the unit so that the controller slides forward through the panel. Hold the bracket steady; do not pull back. Be ready to support the controller as it comes through the front panel. Remove the mounting brackets and retention collar from the back side of the panel.

Figure 11.3a — Retention Collar and Mounting Bracket.

Figure 11.3b — Tightening the Screws.

Figure 11.3c — Disengaging the Mounting Bracket.

Input 1	12.3
Inputs x (2 and 3)	12.4
Digital Inputs x (1 to 4)	12.6
Outputs x (1A, 1B, 2A and 2B)	12.7
Retransmit and Alarm Output	12.8
Digital Outputs x (1 to 8)	12.9
Communications Wiring	12.10
Wiring Example	12.12
Wiring Notes	12.13

Wiring the Series F4

Wiring options depend on the model number, which is printed on the label on the back of the controller. The model number codes are explained in the Appendix.

The labels on the sides and back of the controller contain some basic wiring information.

Input-to-Output Isolation

The Series F4 uses optical and transformer isolation to provide a barrier to prevent ground loops when using grounded sensors and/or peripheral equipment.

Here is a breakdown of the isolation barriers:

- Analog input 1 and all the digital inputs and outputs are grouped together.
- Analog inputs 2 and 3 are grouped together.
- All the control outputs and retransmit outputs are grouped together.
- Both alarm outputs are grouped together.
- Communications is isolated from the other inputs and outputs.

Figure 12.1 — Isolation Blocks.

CAUTION:

If high voltage is applied to a low-voltage unit, irreversible damage will occur.

WARNING:

Provide a labeled switch or circuit breaker connected to the Series F4 power wiring as the means of disconnection for servicing. Failure to do so could result in damage to equipment and/or property, and/or injury or death to personnel.

WARNING:

To avoid damage to property and equipment, and/or injury of loss of life, use National Electric Code (NEC) standard wiring practices to install and operate the Series F4. Failure to do so could result in such damage, and/or injury or death.

CAUTION:

Maintain isolation between analog inputs 2 and 3, and between analog input 1 and digital inputs 1 to 4 to prevent a ground loop. A ground loop may cause incorrect readings. Failure to follow this guideline could result in damage to equipment and product.

Power Wiring

Figure 12.2 — Power wiring.

Sensor Installation Guidelines

Thermocouple inputs: Extension wire for thermocouples must be of the same alloy as the thermocouple to limit errors.

If a grounded thermocouple is required for input 2, the signal to input 3 must be isolated to prevent possible ground loops.

RTD input: Each 1 Ω of lead wire resistance can cause a +2°F error when using a two-wire RTD. A three-wire RTD sensor overcomes this problem. All three wires must have the same electrical resistance (i.e., same gauge, same length, multi-stranded or solid, same metal).

Process input: Isolation must be maintained between input 2 and input 3. If both input 2 and input 3 are process signals, a separate power supply and transmitter must be used for each input. These inputs must be electrically isolated from one another to prevent ground loops.

Input 1

WARNING:

To avoid damage to property and equipment, and/or injury of loss of life, use National Electric Code (NEC) standard wiring practices to install and operate the Series F4. Failure to do so could result in such damage, and/or injury or death.

CAUTION: Maintain isolation between analog inputs 2 and 3, and between analog input 1 and digital inputs 1 to 4 to prevent a ground loop. A ground loop may cause incorrect readings. Failure to follow this guideline could result in damage to equipment and product.

Communications Wiring

If the system does not work properly, it may need termination resistors at each end of the network. A typical installation would require a 120-ohm resistor across the transmit/receive terminals (12 and 13) of the last controller in the network and the converter box or serial card. Pull-up and pull-down 1k resistors may be needed on the first unit to maintain the correct voltage during the idle state.

Glossary

ac (∼) — See alternating current.

ac/dc (**≂**) — Both direct and alternating current.

alternating current — An electric current that reverses at regular intervals, and alternates positive and negative values.

American Wire Gauge (AWG) — A standard of the dimensional characteristics of wire used to conduct electrical current or signals. AWG is identical to the Brown and Sharpe (B & S) wire gauge.

auto-tune — A feature that automatically sets temperature control PID values to match a particular thermal system.

battery — BR1225, retains volatile memory. Sevenyear shelf life, indefinite life with power applied to unit.

baud rate — The rate of information transfer in serial communications, measured in bits per second.

burst fire — A power control method that repeatedly turns on and off full ac cycles. Also called zerocross fire, it switches close to the zero-voltage point of the ac sine wave. Variable-time-base burst fire selectively holds or transits ac cycles to achieve the desired power level. See zero cross.

calibration accuracy — Closeness between the value indicated by a measuring instrument and a physical constant or known standard.

calibration offset — An adjustment to eliminate the difference between the indicated value and the actual process value.

cascade — Control algorithm in which the output of one control loop provides the set point for another loop. The second loop, in turn, determines the control action.

CE — A manufacturer's mark that demonstrates compliance with European Union (EU) laws governing products sold in Europe.

chatter — The rapid on-off cycling of an electromechanical relay or mercury displacement relay due to insufficient controller bandwidth. It is commonly caused by excessive gain, little hysteresis and short cycle time.

CJC — See cold junction compensation.

closed loop — A control system that uses a sensor to measure a process variable and makes decisions based on that feedback.

cold junction — See junction, cold.

cold junction compensation — Electronic means to compensate for the effective temperature at the

cold junction.

control mode — The type of action that a controller uses. For example, on/off, time proportioning, PID, automatic or manual, and combinations of these.

cycle time — The time required for a controller to complete one on-off-on cycle. It is usually expressed in seconds.

deadband — The range through which a variation of the input produces no noticeable change in the output. In the dead band, specific conditions can be placed on control output actions. Operators select the deadband value.

default parameters — The programmed instructions that are permanently stored in the microprocessor software.

derivative — The rate of change in a process variable. Also known as rate. See PID.

derivative control (D) — The last term in the PID control algorithm. Action that anticipates the rate of change of the process, and compensates to minimize overshoot and undershoot. Derivative control is an instantaneous change of the control output in the same direction as the proportional error. This is caused by a change in the process variable (PV) that decreases over the time of the derivative (TD). The TD is in units of seconds.

Deutsche Industrial Norm (DIN) — A set of technical, scientific and dimensional standards developed in Germany. Many DIN standards have worldwide recognition.

droop — In proportional controllers, the difference between set point and actual value after the system stabilizes.

duty cycle — The percentage of a cycle time in which the output is on.

EIA — See Electronics Industries of America.

EIA/TIA -232, -422, -423 and -485 — Data communications standards set by the Electronic Industries of America and Telecommunications Industry Association. Formerly referred to as RS- (Recognized Standard).

Electronics Industries of America (EIA) — An association in the US that establishes standards for electronics and data communications.

external transmitter power supply — A dc voltage source that powers external devices.

filter, digital — A means to slow the response of a system when inputs change unrealistically or too fast. Equivalent to a standard resistor-capacitor (RC) filter.

form A — A single-pole, single-throw relay that uses only the normally open (NO) and common contacts. These contacts close when the relay coil is energized. They open when power is removed from the coil.

form B — A single-pole, single-throw relay that uses only the normally closed (NC) and common contacts. These contacts open when the relay coil is energized. They close when power is removed from the coil.

form C — A single-pole, double-throw relay that uses the normally open (NO), normally closed (NC) and common contacts. The operator can choose to wire for a form A or form B contact.

Hertz (**Hz**) — Frequency, measured in cycles per second.

hysteresis — A change in the process variable required to re-energize the control or alarm output. Sometimes called switching differential.

integral — Control action that automatically eliminates offset, or droop, between set point and actual process temperature.

integral control (I) — A form of temperature control. The I of PID. See integral.

isolation — Electrical separation of sensor from high voltage circuitry. Allows use of grounded or ungrounded sensing element.

JIS — See Joint Industrial Standards.

Joint Industrial Standards (JIS) — A Japanese agency that establishes and maintains standards for equipment and components. Also known as JISC (Japanese Industrial Standards Committee), its function is similar to Germany's Deutsche Industrial Norm (DIN).

junction, cold — Connection point between thermocouple metals and the electronic instrument. See junction, reference.

junction, reference — The junction in a thermocouple circuit held at a stable, known temperature (cold junction). Standard reference temperature is $32^{\circ}F$ (0°C).

LCD — See liquid crystal display.

LED — See light emitting diode.

light emitting diode (LED) — A solid state electronic device that glows when electric current passes through it.

liquid crystal display (**LCD**) — A type of digital display made of a material that changes reflectance or transmittance when an electrical field is applied to it.

limit or limit controller — A highly reliable, discrete safety device (redundant to the primary controller) that monitors and limits the temperature of the process, or a point in the process. When temperature exceeds or falls below the limit set point, the limit controller interrupts power through the load circuit. A limit controller can protect equipment and people when it is correctly installed with its own power supply, power lines, switch and sensor.

manual mode — A selectable mode that has no automatic control aspects. The operator sets output levels.

Modbus[™] — A digital communications protocol owned by AEG Schneider Automation for industrial computer networks.

Modbus^{\mathbb{M}} **RTU** — <u>Remote Terminal Unit</u>, an individual Modbus^{\mathbb{M}}-capable device on a network.

NEMA 4X — A NEMA (National Electrical Manufacturer's Association) specification for determining resistance to moisture infiltration. This rating certifies the controller as washable and corrosion resistant.

on/off controller — A temperature controller that operates in either full on or full off modes.

open loop — A control system with no sensory feedback.

output — Control signal action in response to the difference between set point and process variable.

overshoot — The amount by which a process variable exceeds the set point before it stabilizes.

page — A fixed length block of data that can be stored as a complete unit in the computer memory.

P control — Proportioning control.

PD control — Proportioning control with derivative (rate) action.

PDR control — Proportional derivative control with manual reset, used in fast responding systems where the reset causes instabilities. With PDR control, an operator can enter a manual reset value that eliminates droop in the system.

PI control — Proportioning control with integral (auto-reset) action.

PID — Proportional, integral, derivative. A control mode with three functions: proportional action dampens the system response, integral corrects for droop, and derivative prevents overshoot and undershoot.

process variable — The parameter that is controlled or measured. Typical examples are temperature, relative humidity, pressure, flow, fluid level, events, etc. The high process variable is the highest value of the process range, expressed in engineering units. The low process variable is the lowest value of the process range.

proportional — Output effort proportional to the error from set point. For example, if the proportional band is 20° and the process is 10° below set point, the heat proportioned effort is 50 percent. The lower the PB value, the higher the gain.

proportional band (PB) — A range in which the proportioning function of the control is active. Expressed in units, degrees or percent of span. See PID.

proportional control — A control using only the P (proportional) value of PID control.

radio frequency interference (**RFI**) — Electromagnetic waves between the frequencies of 10 KHz and 300 GHz that can affect susceptible systems by conduction through sensor or power input lines, and by radiation through space.

ramp — A programmed increase in the temperature of a set point system.

range — The area between two limits in which a quantity or value is measured. It is usually described in terms of lower and upper limits.

rate — Anticipatory action that is based on the rate of temperature change, and compensates to minimize overshoot and undershoot. See derivative.

rate band — A range in which the rate function of a controller is active. Expressed in multiples of the proportional band. See PID.

reference junction — see junction, reference.

reset — Control action that automatically eliminates offset, or droop, between set point and actual process temperature. Also see integral.

automatic reset — The integral function of a PI or PID temperature controller that adjusts the process temperature to the set point after the system stabilizes. The inverse of integral.

automatic power reset — A feature in latching limit controls that does not recognize power outage as a limit condition. When power is restored, the output is re-energized automatically, as long as the temperature is within limits.

manual reset — 1) A feature on a limit control that requires human intervention to return the limit to normal operation after a limit condition has occurred. 2) The adjustment of a proportional control to raise the proportional band to compensate for droop.

resistance temperature detector (**RTD**) — A sensor that uses the resistance temperature charac-

teristic to measure temperature. There are two basic types of RTDs: the wire RTD, which is usually made of platinum, and the thermistor, which is made of a semiconductor material. The wire RTD is a positive temperature coefficient sensor only, while the thermistor can have either a negative or positive temperature coefficient.

RFI — See radio frequency interference.

RTD — See resistance temperature detector.

serial communications — A method of transmitting information between devices by sending all bits serially over a single communication channel.

set point — The desired value programmed into a controller. For example, the temperature at which a system is to be maintained.

SI (**Systeme Internationale**) — The system of standard metric units.

switching differential — See hysteresis.

thermal system — A regulated environment that consists of a heat source, heat transfer medium or load, sensing device and a control instrument.

thermocouple (t/c) — A temperature sensing device made by joining two dissimilar metals. This junction produces an electrical voltage in proportion to the difference in temperature between the hot junction (sensing junction) and the lead wire connection to the instrument (cold junction).

thermocouple break protection — The ability of a control to detect a break in the thermocouple circuit and take a predetermined action.

time proportioning control — A method of controlling power by varying the on/off duty cycle of an output. This variance is proportional to the difference between the set point and the actual process temperature.

transmitter — A device that transmits temperature data from either a thermocouple or a resistance temperature detector (RTD) by way of a twowire loop. The loop has an external power supply. The transmitter acts as a variable resistor with respect to its input signal. Transmitters are desirable when long lead or extension wires produce unacceptable signal degradation.

WatView — A Windows-based software application for communicating with and configuring Watlow controllers.

zero cross — Action that provides output switching only at or near the zero-voltage crossing points of the ac sine wave. See burst fire.

zero switching — See zero cross.

Declaration of Conformity Series F4

WATLOW Winona, Inc.

1241 Bundy Boulevard Winona, Minnesota 55987 USA

Declares that the following product: English Designation: Series F4 Model Number(s): F4(S, D or P)(H or L) - (C, E, F or K)(A, C, E, F or K)(A, C, F or K)(A, C, F, K, 0 or 6) – (0, 1 or 2) – (Any three letters or numbers) Classification: Temperature control, Installation Category II, Pollution degree 2 100 to 240 V~ (ac) or 24 to 28 V \eqsim (ac or dc) Rated Voltage: Rated Frequency: 50 or 60 Hz Rated Power Consumption: 39 VA maximum

E

Meets the essential requirements of the following European Union Directives by using the relevant standards show below to indicate compliance.

89/336/EEC Electromagnetic Compatibility Directive

EN 61326:1997 With A1:1998 - Electrical equipment for measurement, control and laboratory use - EMC requirements (Industrial Immunity, Class A Emissions). EN 61000-4-2:1996 With A1, 1998 - Electrostatic Discharge Immunity EN 61000-4-3:1997 - Radiated Field Immunity EN 61000-4-4:1995 - Electrical Fast-Transient / Burst Immunity EN 61000-4-5:1995 With A1, 1996 - Surge Immunity EN 61000-4-6:1996 - Conducted Immunity EN 61000-4-11:1994 Voltage Dips, Short Interruptions and Voltage Variations Immunity EN 61000-3-2:1995 With A1-3:1999 - Harmonic Current Emissions EN 61000-3-3:1995 With A1:1998 - Voltage Fluctuations and Flicker

73/23/EEC Low-Voltage Directive

EN 61010-1:1993 With A1:1995 Safety Requirements of electrical equipment for measurement, control and laboratory use. Part 1: General requirements

déclare que le produit suivant :	Français
Désignation :	Séries F4
Numéros de modèles :	F4(S, D ou P)(H ou L) – (C, E, F ou K)(A, C, E, F ou K)(A, C, F ou K)(A, C, F, K, 0 ou 6) – (0, 1 ou 2) – (N'importe quelle combinaison de trois lettres ou chiffres)
Classification :	Régulation de température, Catégorie d'installation II, Degré de pollution 2
Tension nominale :	100 à 240 V~ (c.a) ou 24 à 28 V ≂ (c.a ou c.c)
Fréquence nominale :	50 ou 60 Hz
Consommation d'alimentati	on nominale : 39 VA maximum

Répond aux normes essentielles des directives suivantes de l'Union européenne en utilisant les standards normalisés ci-dessous qui expliquent les normes auxquelles répondre :

Directive 89/336/CEE sur la compatibilité électromagnétique EN 61326:1997 avec A1 :1998 - Matériel électrique destiné à l'étalonnage, au contrôle et à l'utilisation en laboratoire - Exigences CEM (Immunité indus

trielle, Émissions de catégorie A). EN 61000-4-2:1996 Avec A1, 1998 – Immunité aux décharges électrostatiques EN 61000-4-3:1997 – Immunité aux champs de radiation EN 61000-4-4:1995 – Immunité contre les surtensions électriques rapides/ Rafale

EN 61000-4-5:1995 avec A1, 1996 - Immunité contre les surtensions

EN 61000-4-6:1996 – Immunité conduite EN 61000-4-6:1996 – Immunité conduite EN 61000-4-11:1994 Immunité contre les écarts de tension, interruptions courtes et variations de tension

EN 61000-3-2:1995 avec A1-3 :1999 – Emissions de courant harmoniques EN 61000-3-3:1995 avec A1 :1998 – Fluctuations et vacillements de tension

Directive 73/23/CEE sur les basses tensions

EN 61010-1:1993 avec A1 :1995 Normes de sécurité du matériel électrique pour la mesure, le contrôle et l'utilisation en laboratoire. 1ère partie : Conditions générales

Erklärt, dass das folgende Produkt: Deutsch Bezeichnung: Serie F4 Modell-Nummern: F4(S, D oder P)(H or L) - (C, E, F oder K)(A, C, E, F oder K)(A, C, F or K)(A, C, F, K, 0 oder 6) - (0, 1 oder 2) - (Beliebige drei Ziffern oder Buchstaben) Temperaturregler, Installationskategorie II, Ver-Klassifikation: schmutzungsgrad 2 100 bis 240 V~ (ac) oder 24 bis 28 V = (ac oder dc) Nennspannung: Nennfrequenz: 50 oder 60 Hz Nennstromverbrauch: Max. 39 VA

Erfüllt die wichtigsten Normen der folgenden Anweisung(en) der Europäischen Union unter Verwendung des wichtigsten Abschnitts bzw. der wichtigsten Abschnitte die unten zur Befolgung aufgezeigt werden.

89/336/EEC Elektromagnetische Kompatibilitätsrichtlinie EN 61326:1997 mit A1:1998 - Elektrisches Gerät für Messung, Kontrolle und Laborgebrauch – EMV-Anforderungen (Störfestigkeit Industriebereich, Klasse A Emissionen)

EN 61000-4-2:1996 mit A1, 1998 – Störfestigkeit gegen elektronische Entladung EN 61000-4-3:1997 – Störfestigkeit gegen Strahlungsfelder EN 61000-4-4:1995 – Störfestigkeit gegen schnelle Stöße/Burst EN 61000-4-5:1995 mit A1, 1996 – Störfestigkeit gegen Überspannung EN 61000-4-6:1996 - Geleitete Störfestigkeit EN 61000-4-11:1994 Störfestigkeit gegen Spannungsabfall, kurze Unterbrechungen und Spannungsschwankungen EN 61000-3-2:1995 mit A1-3:1999 - Harmonische Stromemissionen EN 61000-3-3:1995 mit A1:1998 - Spannungsfluktationen und Flimmern EN 61000-3-3: 1995 Grenzen der Spannungsschwankungen und Flimmern

73/23/EEC Niederspannungsrichtlinie

EN 61010-1:1993 mit A1:1995 Sicherheitsanforderungen für elektrische Geräte für Messungen, Kontrolle und Laborgebrauch. Teil 1: Allgemeine Anforderungen

Specifications

Universal Analog Inputs 1 (2 and 3 optional)

• Update rates, In1: 20Hz; In2 and In3: 10Hz Thermocouple

- Type J, K, T, N, C (W5), E, PTII, D (W3), B, R, S **RTD**
- 2- or 3-wire platinum, 100 Ω
- JIS or DIN curves, 1.0 or 0.1 indication

Process

- Input resolution \approx 50,000 bits at full scale
- Range selectable: 0 to 10V^{...} (dc), 0 to 5V^{...} (dc), 1 to 5V^{...} (dc), 0 to 50mV, 0 to 20 mA, 4 to 20 mA
- Voltage input impedance 20 k Ω
- Current input impedance 100 Ω

Digital Inputs (4)

- Update rate: 10 Hz
- Contact or dc voltage (36 V= (dc) maximum)
- 10 kΩ input impedance

Control Outputs (1A, 1B, 2A, 2B)

• Update rate: 20 Hz

Open Collector/Switched DC

- Internal load switching (nominal): Switched dc, 22 to 28V= (dc), limited @ 30 mA
- External load switching (maximum):
- Open collector 42V= (dc) @ 0.5 A

Solid-state Relay

 Zero switched, optically coupled, 0.5 A @ 24V~ (ac) minimum, 253V~ (ac) maximum

Process Outputs (Optional Retransmit)

- Update rate: 1 Hz
- User-selectable 0 to 10V= (dc), 0 to 5V= (dc), 1 to 5V= (dc) @1 k\Omega min., 0 to 20 mA, 4 to 20 mA @ 800 Ω max.
- Resolution: dc ranges: 2.5mV nominal mA ranges: 5 µA nominal
- Calibration accuracy: dc ranges: ±15 mV mA ranges: ±30 µA
- Temperature stability 100ppm/°C

Alarm Outputs

- Output update rate1 Hz
- Electromechanical relay, Form C, 2 A @ 30V= (dc) or 240V~ (ac) maximum

Digital Outputs (8)

- Update rate: 10 Hz
- Open collector output
- Off: 42V-... (dc) max @ 10 μA
- On: 0.2V= (dc) max @ 50 mA sink
- Internal supply: 5V= (dc), @ 80 mA

Communications

EIA-232 and EIA-485 serial communications with Modbus™ RTU protocol

Safety and Agency Approvals

- UL®/C-UL 916-listed, File # E185611
- Process Control Equipment
- CE EMC to EN 61326
- CE Safety to EN 61010
- IP65 and NEMA 4X

Terminals

 Touch-safe, removable terminal blocks, accepts 12- to 22-gauge wire

Power

- 100 to 240V~ (ac), -15%, +10%; 50/60Hz, ±5%
- 24 to 28V≂ (ac/dc), -15%, +10% (order option)
- 39VA maximum power consumption
- Data retention upon power failure via nonvolatile memory (seven years for battery-backed RAM).
 Sensor input isolation from input to input to output to communication circuitry is 500V~ (ac).

Operating Environment

- 32 to 130°F (0 to 55°C)
- 0 to 90% RH, non-condensing
- Storage temperature: -40 to 158°F (-40 to 70°C)

Accuracy

- Calibration accuracy and sensor conformity: ±0.1% of span ±1°C @ 77°F ±5°F (25°C ±3°C) ambient, and rated line voltage ±10% with the following exceptions: Type T, 0.12% of span for -200°C to -50°C Types R and S, 0.15% of span for 0°C to 100°C Type B, 0.24% of span for 870°C to 1700°C
- Accuracy span: Less than or equal to operating ranges, 1000°F (540°C) minimum
- Temperature stability: ±0.1°F/°F (±0.1°C/°C) rise in ambient for thermocouples
- ±0.05°F/°F (±0.05°C/°C) rise in ambient for RTD sensors

Displays

- ° Update rate: 2 Hz
- Process: 5, seven-segment LED red
- Control interface display: high-definition LCD green

Sensor Operating Ranges:

1/4 DIN Single-Channel Ramping Controller

Series F4 F4 S A
¹ / ₄ DIN, Single-Channel
Ramping Controller
Single-Channel
Ramping Controller
1 universal analog input, 4 digital
inputs, 8 digital outputs, 2 alarms,
EIA-232/485 communications
Power Supply
H = 100 to 240V≂ (ac/dc)
$L = 24$ to $28V \approx (ac/dc)$
Output 1A
C = Open collector/switched dc
F = Process, 0 to 5, 1 to 5, 0 to 10V= (dc),
0 to 20 mA, 4 to 20 mA
K = Solid-state Form A 0.5-amp relay
Output 1B
A = None
C = Open collector/switched dc
F = Process, 0 to 5, 1 to 5, 0 to 10V= (dc),
0 to 20 mA, 4 to 20 mA
K = Solid-state Form A 0.5-amp relay
Auxiliary Input Module
0 = None
6 = Dual universal inputs
Auxiliary Retransmit Module
0 = None
1 = Single retransmit output 0 to 5, 1 to 5,
0 to 10V= (dc), 0 to 20 mA, 4 to 20 mA
2 = Dual retransmit outputs 0 to 5, 1 to 5,
0 to 10V= (dc), 0 to 20 mA, 4 to 20 mA
Language and RTD Options —
1 = English with 100 Ω RTD
2 = German with 100 Ω RTD
3 = French with 100 Ω RTD
4 = Spanish with 100 Ω RTD
5 = English with 500 and 1 k Ω RTD
6 = German with 500 and 1 k Ω RTD
7 = French with 500 and 1 k Ω RTD
8 = Spanish with 500 and 1 k Ω RTD
Display and Custom Options
RG = Standard Display (Red/Green display only)
XX = Custom options: software, setting parameters, overlay

✓ *NOTE*:

Some parameters may not appear, depending on the controller model and how it is configured. Some menus may not appear if the controller has already been installed in equipment and the manufacturer has locked out portions of the software.

How to Reach Us

Your Authorized Watlow Distributor:

United States (headquarters):

Watlow Electric Manufacturing Company 12001 Lackland Road St. Louis, Missouri USA 63146 Telephone: +1 (314) 878-4600 Fax: +1 (314) 878-6814

Europe:

Watlow GmbH Industriegebiet Heidig Lauchwasenstr. 1, Postfach 1165, Kronau 76709 Germany Telephone: +49 7253-9400 0 Fax: +49 7253-9400 44

Watlow France S.A.R.L. Immeuble Somag, 16 Rue Ampère, Cergy Pontoise CEDEX 95307 France Telephone: +33 (1) 3073-2425 Fax: +33 (1) 3073-2875

Watlow Italy S.R.L. Via Meucci 14 20094 Corsico MI Italy Telephone: +39 (02) 4588841 Fax: +39 (02) 458-69954

Watlow Limited Robey Close, Linby Industrial Estate, Linby Nottingham England, NG15 8AA Telephone: +44 (0) 115 9640777 Fax: +44 (0) 115 9640071

Latin America:

Watlow de México Av. Fundición #5, Col. Parques Industriales, Querétaro, Qro. México CP-76130 Telephone: +52 (442) 217-6235 Fax: +52 (442) 217-6403

Asia/Pacific:

Watlow Australia Pty., Ltd. 23 Gladstone Park Drive, Tullamarine, Victoria 3043 Australia Telephone: +61 (39) 335-6449 Fax: +61 (39) 330-3566

Watlow China, Inc. 179, Zhong Shan Xi Road Hong Qiao Cointek Bldg, Fl. 4, Unit P Shanghai 200051 China Telephone: +86 (21) 6229-8917 Fax: +86 (21) 6228-4654
